

The code of the package **nicematrix**^{*}

F. Pantigny
fpantigny@wanadoo.fr

August 5, 2025

Abstract

This document is the documented code of the LaTeX package **nicematrix**. It is *not* its user's guide. The guide of utilisation is the document **nicematrix.pdf** (with a French traduction: **nicematrix-french.pdf**).

The development of the extension **nicematrix** is done on the following GitHub depot:
<https://github.com/fpantigny/nicematrix>

1 Declaration of the package and packages loaded

The prefix **nicematrix** has been registered for this package.

See: [<@@=nicematrix>](http://mirrors.ctan.org/macros/latex/contrib/l3kernel/13prefixes.pdf)

First, we load **pgfcore** and the module **shapes**. We do so because it's not possible to use **\usepgfmodule** in **\ExplSyntaxOn**.

```
1 \RequirePackage{pgfcore}
2 \usepgfmodule{shapes}
```

We give the traditional declaration of a package written with the L3 programming layer.

```
3 \ProvidesExplPackage
4   {nicematrix}
5   {\myfiledate}
6   {\myfileversion}
7   {Enhanced arrays with the help of PGF/TikZ}

```

^{*}This document corresponds to the version 7.2 of **nicematrix**, at the date of 2025/08/05.

The command for the treatment of the options of `\usepackage` is at the end of this package for technical reasons.

```
23 \RequirePackage { amsmath }
```

```
24 \RequirePackage { array }
```

In the version 2.6a of `array`, important modifications have been done for the Tagging Project.

```
25 \bool_const:Nn \c_@@_recent_array_bool
26   { \IfPackageAtLeastTF { array } { 2024/05/01 } \c_true_bool \c_false_bool }
27 \bool_const:Nn \c_@@_testphase_table_bool
28   { \IfPackageLoadedTF { latex-lab-testphase-table } \c_true_bool \c_false_bool }
```

```
29 \cs_new_protected:Npn \c_@@_error:n { \msg_error:nn { nicematrix } }
30 \cs_new_protected:Npn \c_@@_warning:n { \msg_warning:nn { nicematrix } }
31 \cs_new_protected:Npn \c_@@_error:nn { \msg_error:nnn { nicematrix } }
32 \cs_generate_variant:Nn \c_@@_error:nn { n e }
33 \cs_new_protected:Npn \c_@@_error:nnn { \msg_error:nnnn { nicematrix } }
34 \cs_new_protected:Npn \c_@@_fatal:n { \msg_fatal:nn { nicematrix } }
35 \cs_new_protected:Npn \c_@@_fatal:nn { \msg_fatal:nnn { nicematrix } }
36 \cs_new_protected:Npn \c_@@_msg_new:nn { \msg_new:nnn { nicematrix } }
```

With Overleaf (and also in TeXPage), by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That's why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
37 \cs_new_protected:Npn \c_@@_msg_new:nnn #1 #2 #3
38 {
39   \bool_if:NTF \g_@@_messages_for_Overleaf_bool
40     { \msg_new:nnn { nicematrix } { #1 } { #2 \\ #3 } }
41     { \msg_new:nnnn { nicematrix } { #1 } { #2 } { #3 } }
42 }
```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by curryfication.

```
43 \cs_new_protected:Npn \c_@@_error_or_warning:n
44 {
45   \bool_if:NTF \g_@@_messages_for_Overleaf_bool
46     { \c_@@_warning:n }
47     { \c_@@_error:n }
48 }
```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always “output”.

```
49 \bool_new:N \g_@@_messages_for_Overleaf_bool
50 \bool_gset:Nn \g_@@_messages_for_Overleaf_bool
51 {
52   \str_if_eq_p:on \c_sys_jobname_str { _region_ } % for Emacs
53   || \str_if_eq_p:ee \c_sys_jobname_str { output } % for Overleaf
54 }

55 \c_@@_msg_new:nn { mdwtab~loaded }
56 {
57   The~packages~'mdwtab'~and~'nicematrix'~are~incompatible.~
58   This~error~is~fatal.
59 }

60 \hook_gput_code:nnn { begindocument / end } { . }
61 { \IfPackageLoadedT { mdwtab } { \c_@@_fatal:n { mdwtab~loaded } } }
```

2 Collecting options

The following technique allows to create user commands with the ability to put an arbitrary number of [list of (key=val)] after the name of the command.

Example :

```
\@@_collect_options:n { \F } [x=a,y=b] [z=c,t=d] { arg }
```

will be transformed in : \F{x=a,y=b,z=c,t=d}{arg}

Therefore, by writing : \def\G{\@@_collect_options:n{\F}},
the command \G takes in an arbitrary number of optional arguments between square brackets.
Be careful: that command is *not* “fully expandable” (because of \peek_meaning:NTF).

```
62 \cs_new_protected:Npn \@@_collect_options:n #1
63 {
64   \peek_meaning:NTF [
65     { \@@_collect_options:nw { #1 } }
66     { #1 { } }
67 }
```

We use \NewDocumentCommand in order to be able to allow nested brackets within the argument between [and].

```
68 \NewDocumentCommand \@@_collect_options:nw { m r[] }
69   { \@@_collect_options:nn { #1 } { #2 } }
70
71 \cs_new_protected:Npn \@@_collect_options:nn #1 #2
72 {
73   \peek_meaning:NTF [
74     { \@@_collect_options:nnw { #1 } { #2 } }
75     { #1 { #2 } }
76 }
77
78 \cs_new_protected:Npn \@@_collect_options:nnw #1#2[#3]
79   { \@@_collect_options:nn { #1 } { #2 , #3 } }
```

3 Technical definitions

The following constants are defined only for efficiency in the tests.

```
80 \tl_const:Nn \c_@@_b_tl { b }
81 \tl_const:Nn \c_@@_c_tl { c }
82 \tl_const:Nn \c_@@_l_tl { l }
83 \tl_const:Nn \c_@@_r_tl { r }
84 \tl_const:Nn \c_@@_all_tl { all }
85 \tl_const:Nn \c_@@_dot_tl { . }
86 \str_const:Nn \c_@@_r_str { r }
87 \str_const:Nn \c_@@_c_str { c }
88 \str_const:Nn \c_@@_l_str { l }
```

The following token list will be used for definitions of user commands (with \NewDocumentCommand) with an embellishment using an *underscore* (there may be problems because of the catcode of the underscore).

```
89 \tl_new:N \l_@_argspec_tl
```

```

90 \cs_generate_variant:Nn \seq_set_split:Nnn { N o }
91 \cs_generate_variant:Nn \str_set:Nn { N o }
92 \cs_generate_variant:Nn \tl_build_put_right:Nn { N o }
93 \prg_generate_conditional_variant:Nnn \clist_if_in:Nn { N e } { T , F, TF }
94 \prg_generate_conditional_variant:Nnn \tl_if_empty:n { e } { T }
95 \prg_generate_conditional_variant:Nnn \tl_if_head_eq_meaning:nN { o N } { TF }
96 \cs_generate_variant:Nn \dim_min:nn { v }
97 \cs_generate_variant:Nn \dim_max:nn { v }

98 \hook_gput_code:nnn { begindocument } { . }
99 {
100   \IfPackageLoadedTF { tikz }
101   {

```

In some constructions, we will have to use a `{pgfpicture}` which *must* be replaced by a `{tikzpicture}` if Tikz is loaded. However, this switch between `{pgfpicture}` and `{tikzpicture}` can't be done dynamically with a conditional because, when the Tikz library `external` is loaded by the user, the pair `\tikzpicture-\endtikzpicture` (or `\begin{tikzpicture}-\end{tikzpicture}`) must be statically “visible” (even when externalization is not activated). That's why we create `\c_@@_pgfortikzpicture_tl` and `\c_@@_endpgfortikzpicture_tl` which will be used to construct in a `\hook_gput_code:nnn { begindocument } { . }` the correct version of some commands. The tokens `\exp_not:N` are mandatory.

```

102   \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \tikzpicture }
103   \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endtikzpicture }
104 }
105 {
106   \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \pgfpicture }
107   \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endpgfpicture }
108 }
109 }

```

We test whether the current class is `revtex4-1` (deprecated) or `revtex4-2` because these classes redefines `\array` (of `array`) in a way incompatible with our programmation. At the date April 2025, the current version `revtex4-2` is 4.2f (compatible with `booktabs`).

```

110 \IfClassLoadedTF { revtex4-1 }
111   { \bool_const:Nn \c_@@_revtex_bool { \c_true_bool } }
112   {
113     \IfClassLoadedTF { revtex4-2 }
114       { \bool_const:Nn \c_@@_revtex_bool { \c_true_bool } }
115       {

```

Maybe one of the previous classes will be loaded inside another class... We try to detect that situation.

```

116   \cs_if_exist:NT \rvtx@iffORMAT@geq
117     { \bool_const:Nn \c_@@_revtex_bool { \c_true_bool } }
118     { \bool_const:Nn \c_@@_revtex_bool { \c_false_bool } }
119   }
120 }

```

If the final user uses `nicematrix`, PGF/Tikz will write instruction `\pgfsyspdfmark` in the `.aux` file. If he changes its mind and no longer loads `nicematrix`, an error may occur at the next compilation because of remanent instructions `\pgfsyspdfmark` in the `.aux` file. With the following code, we try to avoid that situation.

```

121 \cs_new_protected:Npn \@@_provide_pgfsyspdfmark:
122 {
123   \iow_now:Nn \mainaux
124   {
125     \ExplSyntaxOn
126     \cs_if_free:NT \pgfsyspdfmark
127       { \cs_set_eq:NN \pgfsyspdfmark \gobblethree }
128     \ExplSyntaxOff
129   }
130   \cs_gset_eq:NN \@@_provide_pgfsyspdfmark: \prg_do_nothing:
131 }

```

We define a command `\iddots` similar to `\ddots` (‘..) but with dots going forward (‘..). We use `\ProvideDocumentCommand` and so, if the command `\iddots` has already been defined (for example by the package `mathdots`), we don't define it again.

```

132 \ProvideDocumentCommand \iddots { }
133 {
134   \mathinner
135   {
136     \mkern 1 mu
137     \box_move_up:n { 1 pt } { \hbox { . } }
138     \mkern 2 mu
139     \box_move_up:n { 4 pt } { \hbox { . } }
140     \mkern 2 mu
141     \box_move_up:n { 7 pt }
142     { \vbox:n { \kern 7 pt \hbox { . } } }
143     \mkern 1 mu
144   }
145 }
```

This definition is a variant of the standard definition of `\ddots`.

In the `aux` file, we will have the references of the PGF/Tikz nodes created by `nicematrix`. However, when `booktabs` is used, some nodes (more precisely, some `row` nodes) will be defined twice because their position will be modified. In order to avoid an error message in this case, we will redefine `\pgfutil@check@rerun` in the `aux` file.

```

146 \hook_gput_code:nnn { begindocument } { . }
147 {
148   \IfPackageLoadedT { booktabs }
149   { \iow_now:Nn \mainaux { \nicematrix@redefine@check@rerun } }
150 }
151 \cs_set_protected:Npn \nicematrix@redefine@check@rerun
152 {
153   \let \@@_old_pgfutil@check@rerun \pgfutil@check@rerun
```

The new version of `\pgfutil@check@rerun` will not check the PGF nodes whose names start with `nm-` (which is the prefix for the nodes created by `nicematrix`).

```

154   \cs_set_protected:Npn \pgfutil@check@rerun ##1 ##2
155   {
\str_if_eq:ee(TF) is faster than \str_if_eq:nn(TF).
156   \str_if_eq:eeF { nm- } { \tl_range:nnn { ##1 } { 1 } { 3 } }
157   { \@@_old_pgfutil@check@rerun { ##1 } { ##2 } }
158 }
159 }
```

We have to know whether `colortbl` is loaded in particular for the redefinition of `\everycr`.

```

160 \hook_gput_code:nnn { begindocument } { . }
161 {
162   \cs_set_protected:Npe \@@_everycr:
163   {
164     \IfPackageLoadedTF { colortbl } { \CT@everycr } { \everycr }
165     { \noalign { \@@_in_everycr: } }
166   }
167   \IfPackageLoadedTF { colortbl }
168   {
169     \cs_set_eq:NN \@@_old_cellcolor: \cellcolor
170     \cs_set_eq:NN \@@_old_rowcolor: \rowcolor
171     \cs_new_protected:Npn \@@_revert_colortbl:
172     {
173       \hook_gput_code:nnn { env / tabular / begin } { nicematrix }
174       {
175         \cs_set_eq:NN \cellcolor \@@_old_cellcolor:
176         \cs_set_eq:NN \rowcolor \@@_old_rowcolor:
```

```

177     }
178 }
```

When `colortbl` is used, we have to catch the tokens `\columncolor` in the preamble because, otherwise, `colortbl` will catch them and the colored panels won't be drawn by `nicematrix` but by `colortbl` (with an output which is not perfect).

```

179     \cs_new_protected:Npn \@@_replace_columncolor:
180     {
181         \tl_replace_all:Nnn \g_@@_array_preamble_tl
182         { \columncolor }
183         { \@@_columncolor_preamble }
```

`\@@_column_preamble`, despite its name, will be defined with `\NewDocumentCommand` because it takes in an optional argument between square brackets in first position for the colorimetric space.

```

184     }
185     }
186     {
187         \cs_new_protected:Npn \@@_revert_colortbl: { }
188         \cs_new_protected:Npn \@@_replace_columncolor:
189             { \cs_set_eq:NN \columncolor \@@_columncolor_preamble }
```

The command `\CT@arc@` is a command of `colortbl` which sets the color of the rules in the array. We will use it to store the instruction of color for the rules even if `colortbl` is not loaded.

```

190     \def \CT@arc@ { }
191     \def \arrayrulecolor #1 # { \CT@arc { #1 } }
192     \def \CT@arc #1 #2
193     {
194         \dim_compare:nNnT { \baselineskip } = { \c_zero_dim } { \noalign }
195             { \cs_gset_nopar:Npn \CT@arc@ { \color #1 { #2 } } }
196     }
```

Idem for `\CT@drs@`.

```

197     \def \doublerulesepcolor #1 # { \CT@drs { #1 } }
198     \def \CT@drs #1 #2
199     {
200         \dim_compare:nNnT { \baselineskip } = { \c_zero_dim } { \noalign }
201             { \cs_gset:Npn \CT@drsc@ { \color #1 { #2 } } }
202     }
203     \def \hline
204     {
205         \noalign { \ifnum 0 = `} \fi
206             \cs_set_eq:NN \hskip \vskip
207             \cs_set_eq:NN \vrule \hrule
208             \cs_set_eq:NN \width \height
209             { \CT@arc@ \vline }
210             \futurelet \reserved@a
211             \xhline
212     }
213 }
```

We have to redefine `\cline` for several reasons. The command `\@@_cline:` will be linked to `\cline` in the beginning of `{NiceArrayWithDelims}`. The following commands must *not* be protected.

```

215 \cs_set_nopar:Npn \@@_standard_cline: #1 { \@@_standard_cline:w #1 \q_stop }
216 \cs_set_nopar:Npn \@@_standard_cline:w #1-#2 \q_stop
217 {
218     \int_if_zero:nT { \l_@@_first_col_int } { \omit & }
219     \int_compare:nNnT { #1 } > { \c_one_int }
220         { \multispan { \int_eval:n { #1 - 1 } } & }
221         \multispan { \int_eval:n { #2 - #1 + 1 } } }
222     {
223         \CT@arc@
224         \leaders \hrule \height \arrayrulewidth \hfill
```

The following `\skip_horizontal:N \c_zero_dim` is to prevent a potential `\unskip` to delete the `\leaders`¹

```
225     \skip_horizontal:N \c_zero_dim
226 }
```

Our `\everycr` has been modified. In particular, the creation of the `row` node is in the `\everycr` (maybe we should put it with the incrementation of `\c@iRow`). Since the following `\cr` correspond to a “false row”, we have to nullify `\everycr`.

```
227 \everycr { }
228 \cr
229 \noalign { \skip_vertical:n { - \arrayrulewidth } }
230 }
```

The following version of `\cline` spreads the array of a quantity equal to `\arrayrulewidth` as does `\hline`. It will be loaded excepted if the key `standard-cline` has been used.

```
231 \cs_set:Npn \@@_cline:
```

We have to act in a fully expandable way since there may be `\noalign` (in the `\multispan`) to detect. That’s why we use `\@@_cline_i:en`.

```
232 { \@@_cline_i:en \l_@@_first_col_int }
```

The command `\cline_i:nn` has two arguments. The first is the number of the current column (it *must* be used in that column). The second is a standard argument of `\cline` of the form *i-j* or the form *i*.

```
233 \cs_set:Npn \@@_cline_i:nn #1 #2 { \@@_cline_i:w #1|#2- \q_stop }
234 \cs_generate_variant:Nn \@@_cline_i:nn { e }
235 \cs_set:Npn \@@_cline_i:w #1|#2-#3 \q_stop
236 {
237     \tl_if_empty:nTF { #3 }
238         { \@@_cline_iii:w #1|#2-#2 \q_stop }
239         { \@@_cline_ii:w #1|#2-#3 \q_stop }
240     }
241 \cs_set:Npn \@@_cline_ii:w #1|#2-#3- \q_stop
242     { \@@_cline_iii:w #1|#2-#3 \q_stop }
243 \cs_set:Npn \@@_cline_iii:w #1|#2-#3 \q_stop
244 }
```

Now, `#1` is the number of the current column and we have to draw a line from the column `#2` to the column `#3` (both included).

```
245 \int_compare:nNnT { #1 } < { #2 }
246     { \multispan { \int_eval:n { #2 - #1 } } & }
247 \multispan { \int_eval:n { #3 - #2 + 1 } } }
248 {
249     \CT@arc@
250     \leaders \hrule \height \arrayrulewidth \hfill
251     \skip_horizontal:N \c_zero_dim
252 }
```

You look whether there is another `\cline` to draw (the final user may put several `\cline`).

```
253 \peek_meaning_remove_ignore_spaces:NTF \cline
254     { & \@@_cline_i:en { \int_eval:n { #3 + 1 } } }
255     { \everycr { } \cr }
256 }
```

The following command will be nullified in the environment `{NiceTabular}`, `{NiceTabular*}` and `{NiceTabularX}`.

```
257 \cs_set_eq:NN \@@_math_toggle: \c_math_toggle_token
```

¹See question 99041 on TeX StackExchange.

```

258 \cs_new_protected:Npn \@@_set_CTarc:n #1

292     }
293     #1
294 }

```

The L3 programming layer provides scratch dimensions `\l_tmpa_dim` and `\l_tmpb_dim`. We create several more in the same spirit.

```

295 \dim_new:N \l_@@_tmpc_dim
296 \dim_new:N \l_@@_tmpd_dim
297 \dim_new:N \l_@@_tmpe_dim
298 \dim_new:N \l_@@_tmpf_dim

299 \tl_new:N \l_@@_tmpc_tl
300 \tl_new:N \l_@@_tmpd_tl

301 \int_new:N \l_@@_tmpc_int

```

4 Parameters

The following counter will count the environments `{NiceArray}`. The value of this counter will be used to prefix the names of the Tikz nodes created in the array.

```
302 \int_new:N \g_@@_env_int
```

The following command is only a syntactic shortcut. It must *not* be protected (it will be used in names of PGF nodes).

```
303 \cs_new:Npn \@@_env: { nm - \int_use:N \g_@@_env_int }
```

The command `\NiceMatrixLastEnv` is not used by the package `nicematrix`. It's only a facility given to the final user. It gives the number of the last environment (in fact the number of the current environment but it's meant to be used after the environment in order to refer to that environment — and its nodes — without having to give it a name). This command *must* be expandable since it will be used in pgf nodes.

```
304 \NewExpandableDocumentCommand \NiceMatrixLastEnv { }
305   { \int_use:N \g_@@_env_int }
```

The following command is only a syntactic shortcut. The `q` in `qpoint` means *quick*.

```
306 \cs_new_protected:Npn \@@_qpoint:n #1
307   { \pgfpointanchor { \@@_env: - #1 } { center } }
```

If the user uses `{NiceTabular}`, `{NiceTabular*}` or `{NiceTabularX}`, we will raise the following flag.

```
308 \bool_new:N \l_@@_tabular_bool
```

`\g_@@_delims_bool` will be true for the environments with delimiters (ex. : `{pNiceMatrix}`, `{pNiceArray}`, `\pAutoNiceMatrix`, etc.).

```
309 \bool_new:N \g_@@_delims_bool
310 \bool_gset_true:N \g_@@_delims_bool
```

In fact, if there is delimiters in the preamble of `{NiceArray}` (eg: `[cccc]`), this boolean will be set to false.

The following boolean will be equal to `true` in the environments which have a preamble (provided by the final user): `{NiceTabular}`, `{NiceArray}`, `{pNiceArray}`, etc.

```
311 \bool_new:N \l_@@_preamble_bool
312 \bool_set_true:N \l_@@_preamble_bool
```

We need a special treatment for `{NiceMatrix}` when `vlines` is not used, in order to retrieve `\arraycolsep` on both sides.

```
313 \bool_new:N \l_@@_NiceMatrix_without_vlines_bool
```

The following counter will count the environments `{NiceMatrixBlock}`.

```
314 \int_new:N \g_@@_NiceMatrixBlock_int
```

It's possible to put tabular notes (with `\tabularnote`) in the caption if that caption is composed *above* the tabular. In such case, we will count in `\g_@@_notes_caption_int` the number of uses of the command `\tabularnote` *without optional argument* in that caption.

```
315 \int_new:N \g_@@_notes_caption_int
```

The dimension `\l_@@_columns_width_dim` will be used when the options specify that all the columns must have the same width (but, if the key `columns-width` is used with the special value `auto`, the boolean `\l_@@_auto_columns_width_bool` also will be raised).

```
316 \dim_new:N \l_@@_columns_width_dim
```

The dimension `\l_@@_col_width_dim` will be available in each cell which belongs to a column of fixed width: `w{...}{...}`, `W{...}{...}`, `p{...}`, `m{...}`, `b{...}` but also `X` (when the actual width of that column is known, that is to say after the first compilation). It's the width of that column. It will be used by some commands `\Block`. A non positive value means that the column has no fixed width (it's a column of type `c`, `r`, `l`, etc.).

```
317 \dim_new:N \l_@@_col_width_dim
318 \dim_set:Nn \l_@@_col_width_dim { -1 cm }
```

The following counters will be used to count the numbers of rows and columns of the array.

```
319 \int_new:N \g_@@_row_total_int
320 \int_new:N \g_@@_col_total_int
```

The following parameter will be used by `\@_create_row_node`: to avoid to create the same row-node twice (at the end of the array).

```
321 \int_new:N \g_@@_last_row_node_int
```

The following counter corresponds to the key `nb-rows` of the command `\RowStyle`.

```
322 \int_new:N \l_@@_key_nb_rows_int
```

The following token list will contain the type of horizontal alignment of the current cell as provided by the corresponding column. The possible values are `r`, `l`, `c` and `j`. For example, a column `p[1]{3cm}` will provide the value `l` for all the cells of the column.

```
323 \tl_new:N \l_@@_hpos_cell_tl
324 \tl_set_eq:NN \l_@@_hpos_cell_tl \c_@@_c_tl
```

When there is a mono-column block (created by the command `\Block`), we want to take into account the width of that block for the width of the column. That's why we compute the width of that block in the `\g_@@_blocks_wd_dim` and, after the construction of the box `\l_@@_cell_box`, we change the width of that box to take into account the length `\g_@@_blocks_wd_dim`.

```
325 \dim_new:N \g_@@_blocks_wd_dim
```

Idem for the mono-row blocks.

```
326 \dim_new:N \g_@@_blocks_ht_dim
327 \dim_new:N \g_@@_blocks_dp_dim
```

The following dimension correspond to the key `width` (which may be fixed in `\NiceMatrixOptions` but also in an environment `{NiceTabular}`).

```
328 \dim_new:N \l_@@_width_dim
```

The clist `\g_@@_names_clist` will be the list of all the names of environments used (via the option `name`) in the document: two environments must not have the same name. However, it's possible to use the option `allow-duplicate-names`.

```
329 \clist_new:N \g_@@_names_clist
```

We want to know whether we are in an environment of `nicematrix` because we will raise an error if the user tries to use nested environments.

```
330 \bool_new:N \l_@@_in_env_bool
```

The following key corresponds to the key `notes/detect_duplicates`.

```
331 \bool_new:N \l_@@_notes_detect_duplicates_bool
332 \bool_set_true:N \l_@@_notes_detect_duplicates_bool
```

```
333 \bool_new:N \l_@@_initial_open_bool
334 \bool_new:N \l_@@_final_open_bool
335 \bool_new:N \l_@@_Vbrace_bool
```

If the user uses `{NiceTabular*}`, the width of the tabular (in the first argument of the environment `{NiceTabular*}`) will be stored in the following dimension.

```
336 \dim_new:N \l_@@_tabular_width_dim
```

The following dimension will be used for the total width of composite rules (*total* means that the spaces on both sides are included).

```
337 \dim_new:N \l_@@_rule_width_dim
```

The key `color` in a command of rule such as `\Hline` (or the specifier “`|`” in the preamble of an environment).

```
338 \tl_new:N \l_@@_rule_color_tl
```

The following boolean will be raised when the command `\rotate` is used.

```
339 \bool_new:N \g_@@_rotate_bool
```

The following boolean will be raise then the command `\rotate` is used with the key `c`.

```
340 \bool_new:N \g_@@_rotate_c_bool
```

In a cell, it will be possible to know whether we are in a cell of a column of type `X` thanks to that flag (the `X` columns of `nicematrix` are inspired by those of `tabularx`). You will use that flag for the blocks.

```
341 \bool_new:N \l_@@_X_bool
```

`\l_@@_V_of_X_bool` during the construction of the preamble when a column of type `X` uses the key `V` (whose name is inspired by the columns `V` of the extension `varwidth`).

```
342 \bool_new:N \l_@@_V_of_X_bool
```

The flag `g_@@_V_of_X_bool` will be raised when there is at least in the tabular a column of type `X` using the key `V`.

```
343 \bool_new:N \g_@@_V_of_X_bool
```

```
344 \bool_new:N \g_@@_caption_finished_bool
```

The following boolean will be raised when the key `no-cell-nodes` is used.

```
345 \bool_new:N \l_@@_no_cell_nodes_bool
```

We will write in `\g_@@_aux_tl` all the instructions that we have to write on the `aux` file for the current environment. The contain of that token list will be written on the `aux` file at the end of the environment (in an instruction `\tl_gset:cn { g_@@_ \int_use:N \g_@@_env_int _ tl }`).

```
346 \tl_new:N \g_@@_aux_tl
```

During the second run, if information concerning the current environment has been found in the `aux` file, the following flag will be raised.

```
347 \bool_new:N \g_@@_aux_found_bool
```

In particular, in that `aux` file, there will be, for each environment of `nicematrix`, an affectation for the the following sequence that will contain information about the size of the array.

```
348 \seq_new:N \g_@@_size_seq
```

```
349 \tl_new:N \g_@@_left_delim_tl
```

```
350 \tl_new:N \g_@@_right_delim_tl
```

The token list `\g_@@_user_preamble_tl` will contain the preamble provided by the the final user of `nicematrix` (eg the preamble of an environment `{NiceTabular}`).

```
351 \tl_new:N \g_@@_user_preamble_tl
```

The token list `\g_@@_array_preamble_tl` will contain the preamble constructed by `nicematrix` for the environment `{array}` (of `array`).

```
352 \tl_new:N \g_@@_array_preamble_tl
For \multicolumn.
```

```
353 \tl_new:N \g_@@_preamble_tl
```

The following parameter corresponds to the key `columns-type` of the environments `{NiceMatrix}`, `{pNiceMatrix}`, etc. and also the key `matrix / columns-type` of `\NiceMatrixOptions`.

```
354 \tl_new:N \l_@@_columns_type_tl
355 \str_set:Nn \l_@@_columns_type_tl { c }
```

The following parameters correspond to the keys `down`, `up` and `middle` of a command such as `\Cdots`. Usually, the final user doesn't use that keys directly because he uses the syntax with the embellishments `_`, `^` and `:`.

```
356 \tl_new:N \l_@@_xdots_down_tl
357 \tl_new:N \l_@@_xdots_up_tl
358 \tl_new:N \l_@@_xdots_middle_tl
```

We will store in the following sequence information provided by the instructions `\rowlistcolors` in the main array (not in the `\CodeBefore`).

```
359 \seq_new:N \g_@@_rowlistcolors_seq
```

```
360 \cs_new_protected:Npn \@@_test_if_math_mode:
361 {
362     \if_mode_math: \else:
363         \@@_fatal:n { Outside~math~mode }
364     \fi:
365 }
```

The list of the columns where vertical lines in sub-matrices (`vlism`) must be drawn. Of course, the actual value of this sequence will be known after the analyse of the preamble of the array.

```
366 \seq_new:N \g_@@_cols_vlism_seq
```

The following colors will be used to memorize the color of the potential “first col” and the potential “first row”.

```
367 \colorlet{nicematrix-last-col}{.}
368 \colorlet{nicematrix-last-row}{.}
```

The following string is the name of the current environment or the current command of `nicematrix` (despite its name which contains `env`).

```
369 \str_new:N \g_@@_name_env_str
```

The following string will contain the word `command` or `environment` whether we are in a command of `nicematrix` or in an environment of `nicematrix`. The default value is `environment`.

```
370 \tl_new:N \g_@@_com_or_env_str
371 \tl_gset:Nn \g_@@_com_or_env_str { environment }
```

```
372 \bool_new:N \l_@@_bold_row_style_bool
```

The following command will be able to reconstruct the full name of the current command or environment (despite its name which contains `env`). This command must *not* be protected since it will be used in error messages and we have to use `\str_if_eq:eeTF` and not `\tl_if_eq:eeTF` because we need to be fully expandable). `\str_if_eq:ee(TF)` is faster than `\str_if_eq:nn(TF)`.

```
373 \cs_new:Npn \@@_full_name_env:
374 {
375     \str_if_eq:eeTF \g_@@_com_or_env_str { command }
376     { command \space \c_underscore_str \g_@@_name_env_str }
377     { environment \space \{ \g_@@_name_env_str \} }
378 }
```

```
379 \tl_new:N \g_@@_cell_after_hook_tl % 2025/03/22
```

For the key `code` of the command `\SubMatrix` (itself in the main `\CodeAfter`), we will use the following token list.

```
380 \tl_new:N \l_@@_code_t1
```

For the key `pgf-node-code`. That code will be used when the nodes of the cells (that is to say the nodes of the form `i-j`) will be created.

```
381 \tl_new:N \l_@@_pgf_node_code_t1
```

The so-called `\CodeBefore` is split in two parts because we want to control the order of execution of some instructions.

```
382 \tl_new:N \g_@@_pre_code_before_t1  
383 \tl_new:N \g_nicematrix_code_before_t1
```

The value of the key `code-before` will be added to the left of `\g_@@_pre_code_before_t1`. Idem for the code between `\CodeBefore` and `\Body`.

The so-called `\CodeAfter` is split in two parts because we want to control the order of execution of some instructions.

```
384 \tl_new:N \g_@@_pre_code_after_t1  
385 \tl_new:N \g_nicematrix_code_after_t1
```

The `\CodeAfter` provided by the final user (with the key `code-after` or the keyword `\CodeAfter`) will be stored in the second token list.

```
386 \bool_new:N \l_@@_in_code_after_bool
```

The following parameter will be raised when a block contains an ampersand (`&`) in its content (=label).

```
387 \bool_new:N \l_@@_ampersand_bool
```

The counters `\l_@@_old_iRow_int` and `\l_@@_old_jCol_int` will be used to save the values of the potential LaTeX counters `iRow` and `jCol`. These LaTeX counters will be restored at the end of the environment.

```
388 \int_new:N \l_@@_old_iRow_int  
389 \int_new:N \l_@@_old_jCol_int
```

The TeX counters `\c@iRow` and `\c@jCol` will be created in the beginning of `{NiceArrayWithDelims}` (if they don't exist previously).

The following sequence will contain the names (without backslash) of the commands created by `custom-line` by the key `command` or `ccommand` (commands used by the final user in order to draw horizontal rules).

```
390 \seq_new:N \l_@@_custom_line_commands_seq
```

The following token list corresponds to the key `rules/color` available in the environments.

```
391 \tl_new:N \l_@@_rules_color_t1
```

The sum of the weights of all the X-columns in the preamble.

```
392 \fp_new:N \g_@@_total_X_weight_fp
```

If there is at least one X-column in the preamble of the array, the following flag will be raised via the aux file. The length `\l_@@_X_columns_dim` will be the width of X-columns of weight 1.0 (the width of a column of weight `x` will be that dimension multiplied by `x`). That value is computed after the construction of the array during the first compilation in order to be used in the following run.

```
393 \bool_new:N \l_@@_X_columns_aux_bool  
394 \dim_new:N \l_@@_X_columns_dim
```

This boolean will be used only to detect in an expandable way whether we are at the beginning of the (potential) column zero, in order to raise an error if `\Hdotsfor` is used in that column.

```
395 \bool_new:N \g_@@_after_col_zero_bool
```

A kind of false row will be inserted at the end of the array for the construction of the `col` nodes (and also to fix the width of the columns when `columns-width` is used). When this special row will be created, we will raise the flag `\g_@@_row_of_col_done_bool` in order to avoid some actions set in the redefinition of `\everycr` when the last `\cr` of the `\halign` will occur (after that row of `col` nodes).

```
396 \bool_new:N \g_@@_row_of_col_done_bool
```

It's possible to use the command `\NotEmpty` to specify explicitly that a cell must be considered as non empty by `nicematrix` (the Tikz nodes are constructed only in the non empty cells).

```
397 \bool_new:N \g_@@_not_empty_cell_bool
```

```
398 \tl_new:N \l_@@_code_before_tl
399 \bool_new:N \l_@@_code_before_bool
```

The following token list will contain the code inserted in each cell of the current row (this token list will be cleared at the beginning of each row).

```
400 \tl_new:N \g_@@_row_style_tl
```

The following dimensions will be used when drawing the dotted lines.

```
401 \dim_new:N \l_@@_x_initial_dim
402 \dim_new:N \l_@@_y_initial_dim
403 \dim_new:N \l_@@_x_final_dim
404 \dim_new:N \l_@@_y_final_dim

405 \dim_new:N \g_@@_dp_row_zero_dim
406 \dim_new:N \g_@@_ht_row_zero_dim
407 \dim_new:N \g_@@_ht_row_one_dim
408 \dim_new:N \g_@@_dp_ante_last_row_dim
409 \dim_new:N \g_@@_ht_last_row_dim
410 \dim_new:N \g_@@_dp_last_row_dim
```

Some cells will be declared as “empty” (for example a cell with an instruction `\Cdots`).

```
411 \bool_new:N \g_@@_empty_cell_bool
```

The following dimensions will be used internally to compute the width of the potential “first column” and “last column”.

```
412 \dim_new:N \g_@@_width_last_col_dim
413 \dim_new:N \g_@@_width_first_col_dim
```

The following sequence will contain the characteristics of the blocks of the array, specified by the command `\Block`. Each block is represented by 6 components surrounded by curly braces: `{imin}{jmin}{imax}{jmax}{options}{contents}`.

The variable is global because it will be modified in the cells of the array.

```
414 \seq_new:N \g_@@_blocks_seq
```

We also manage a sequence of the *positions* of the blocks. In that sequence, each block is represented by only five components: `{imin}{jmin}{imax}{jmax}{name}`. A block with the key `hvlines` won't appear in that sequence (otherwise, the lines in that block would not be drawn!).

```
415 \seq_new:N \g_@@_pos_of_blocks_seq
```

In fact, this sequence will also contain the positions of the cells with a `\diagbox`. The sequence `\g_@@_pos_of_blocks_seq` will be used when we will draw the rules (which respect the blocks).

In the `\CodeBefore`, the value of `\g_@@_pos_of_blocks_seq` will be the value read in the `aux` file from a previous run. However, in the `\CodeBefore`, the commands `\EmptyColumn` and `\EmptyRow` will write virtual positions of blocks in the following sequence.

416 `\seq_new:N \g_@@_future_pos_of_blocks_seq`

The, after the execution of the `\CodeBefore`, the sequence `\g_@@_pos_of_blocs_seq` will be erased and replaced by the value of `\g_@@_future_pos_of_blocks_seq`.

We will also manage a sequence for the positions of the dotted lines. These dotted lines are created in the array by `\Cdots`, `\Vdots`, `\Ddots`, etc. However, their positions, that is to say, their extremities, will be determined only after the construction of the array. In this sequence, each item contains five components: `{imin}{jmin}{imax}{jmax}{ name}`.

417 `\seq_new:N \g_@@_pos_of_xdots_seq`

The sequence `\g_@@_pos_of_xdots_seq` will be used when we will draw the rules required by the key `hvlines` (these rules won't be drawn within the virtual blocks corresponding to the dotted lines).

The final user may decide to “stroke” a block (using, for example, the key `draw=red!15` when using the command `\Block`). In that case, the rules specified, for instance, by `hvlines` must not be drawn around the block. That's why we keep the information of all that stroken blocks in the following sequence.

418 `\seq_new:N \g_@@_pos_of_stroken_blocks_seq`

If the user has used the key `corners`, all the cells which are in an (empty) corner will be stored in the following list. We use a `clist` instead of a `seq` because we will frequently search in that list (and searching in a `clist` is faster than searching in a `seq`).

419 `\clist_new:N \l_@@_corners_cells_clist`

The list of the names of the potential `\SubMatrix` in the `\CodeAfter` of an environment. Unfortunately, that list has to be global (we have to use it inside the group for the options of a given `\SubMatrix`).

420 `\seq_new:N \g_@@_submatrix_names_seq`

The following flag will be raised if the key `width` is used in an environment `{NiceTabular}` (not in a command `\NiceMatrixOptions`). You use it to raise an error when this key is used while no column `X` is used.

421 `\bool_new:N \l_@@_width_used_bool`

The sequence `\g_@@_multicolumn_cells_seq` will contain the list of the cells of the array where a command `\multicolumn{n}{...}{...}` with $n > 1$ is issued. In `\g_@@_multicolumn_sizes_seq`, the “sizes” (that is to say the values of n) correspondent will be stored. These lists will be used for the creation of the “medium nodes” (if they are created).

422 `\seq_new:N \g_@@_multicolumn_cells_seq`

423 `\seq_new:N \g_@@_multicolumn_sizes_seq`

By default, the diagonal lines will be parallelized². There are two types of diagonals lines: the `\Ddots` diagonals and the `\Idots` diagonals. We have to count both types in order to know whether a diagonal is the first of its type in the current `{NiceArray}` environment.

424 `\int_new:N \g_@@_ddots_int`

425 `\int_new:N \g_@@_iddots_int`

²It's possible to use the option `parallelize-diags` to disable this parallelization.

The dimensions `\g_@@_delta_x_one_dim` and `\g_@@_delta_y_one_dim` will contain the Δ_x and Δ_y of the first `\Ddots` diagonal. We have to store these values in order to draw the others `\Ddots` diagonals parallel to the first one. Similarly `\g_@@_delta_x_two_dim` and `\g_@@_delta_y_two_dim` are the Δ_x and Δ_y of the first `\Iddots` diagonal.

```
426 \dim_new:N \g_@@_delta_x_one_dim
427 \dim_new:N \g_@@_delta_y_one_dim
428 \dim_new:N \g_@@_delta_x_two_dim
429 \dim_new:N \g_@@_delta_y_two_dim
```

The following counters will be used when searching the extremities of a dotted line (we need these counters because of the potential “open” lines in the `\SubMatrix`—the `\SubMatrix` in the `code-before`).

```
430 \int_new:N \l_@@_row_min_int
431 \int_new:N \l_@@_row_max_int
432 \int_new:N \l_@@_col_min_int
433 \int_new:N \l_@@_col_max_int

434 \int_new:N \l_@@_initial_i_int
435 \int_new:N \l_@@_initial_j_int
436 \int_new:N \l_@@_final_i_int
437 \int_new:N \l_@@_final_j_int
```

The following counters will be used when drawing the rules.

```
438 \int_new:N \l_@@_start_int
439 \int_set_eq:NN \l_@@_start_int \c_one_int
440 \int_new:N \l_@@_end_int
441 \int_new:N \l_@@_local_start_int
442 \int_new:N \l_@@_local_end_int
```

The following sequence will be used when the command `\SubMatrix` is used in the `\CodeBefore` (and not in the `\CodeAfter`). It will contain the position of all the sub-matrices specified in the `\CodeBefore`. Each sub-matrix is represented by an “object” of the form $\{i\}\{j\}\{k\}\{l\}$ where i and j are the number of row and column of the upper-left cell and k and l the number of row and column of the lower-right cell.

```
443 \seq_new:N \g_@@_submatrix_seq
```

We are able to determine the number of columns specified in the preamble (for the environments with explicit preamble of course and without the potential exterior columns).

```
444 \int_new:N \g_@@_static_num_of_col_int
```

The following parameters correspond to the keys `fill`, `opacity`, `draw`, `tikz`, `borders`, and `rounded-corners` of the command `\Block`.

```
445 \tl_new:N \l_@@_fill_tl
446 \tl_new:N \l_@@_opacity_tl
447 \tl_new:N \l_@@_draw_tl
448 \seq_new:N \l_@@_tikz_seq
449 \clist_new:N \l_@@_borders_clist
450 \dim_new:N \l_@@_rounded_corners_dim
```

The last parameter has no direct link with the [empty] corners of the array (which are computed and taken into account by `nicematrix` when the key `corners` is used).

The following dimension corresponds to the key `rounded-corners` available in an individual environment `{NiceTabular}`. When that key is used, a clipping is applied in the `\CodeBefore` of the environment in order to have rounded corners for the potential colored panels.

```
451 \dim_new:N \l_@@_tab_rounded_corners_dim
```

The following token list correspond to the key `color` of the command `\Block` and also the key `color` of the command `\RowStyle`.

```
452 \tl_new:N \l_@@_color_tl
```

In the key `tikz` of a command `\Block` or in the argument of a command `\TikzEveryCell`, the final user puts a list of tikz keys. But, you have added another key, named `offset` (which means that an offset will be used for the frame of the block or the cell). The following parameter corresponds to that key.

```
453 \dim_new:N \l_@@_offset_dim
```

Here is the dimension for the width of the rule when a block (created by `\Block`) is stroked or when the key `hvlines` is used.

```
454 \dim_new:N \l_@@_line_width_dim
```

The parameters of the horizontal position of the label of a block. If the user uses the key `c` or `C`, the value is `c`. If the user uses the key `l` or `L`, the value is `l`. If the user uses the key `r` or `R`, the value is `r`. If the user has used a capital letter, the boolean `\l_@@_hpos_of_block_cap_bool` will be raised (in the second pass of the analyze of the keys of the command `\Block`).

```
455 \str_new:N \l_@@_hpos_block_str
456 \str_set:Nn \l_@@_hpos_block_str { c }
457 \bool_new:N \l_@@_hpos_of_block_cap_bool
458 \bool_new:N \l_@@_p_block_bool
```

If the final user has used the special color “`nocolor`”, the following flag will be raised.

```
459 \bool_new:N \l_@@_nocolor_used_bool
```

For the vertical position, the possible values are `c`, `t`, `b`, `T` and `B` (but `\l_@@_vpos_block_str` will remain empty if the user doesn't use a key for the vertical position).

```
460 \str_new:N \l_@@_vpos_block_str
```

Used when the key `draw-first` is used for `\Ddots` or `\Idots`.

```
461 \bool_new:N \l_@@_draw_first_bool
```

The following flag corresponds to the keys `vlines` and `hlines` of the command `\Block` (the key `hvlines` is the conjunction of both).

```
462 \bool_new:N \l_@@_vlines_block_bool
463 \bool_new:N \l_@@_hlines_block_bool
```

The blocks which use the key `-` will store their content in a box. These boxes are numbered with the following counter.

```
464 \int_new:N \g_@@_block_box_int
465 \dim_new:N \l_@@_submatrix_extra_height_dim
466 \dim_new:N \l_@@_submatrix_left_xshift_dim
467 \dim_new:N \l_@@_submatrix_right_xshift_dim
468 \clist_new:N \l_@@_hlines_clist
469 \clist_new:N \l_@@_vlines_clist
470 \clist_new:N \l_@@_submatrix_hlines_clist
471 \clist_new:N \l_@@_submatrix_vlines_clist
```

The following key is set when the keys `hvlines` and `hvlines-except-borders` are used. It's used only to change slightly the clipping path set by the key `rounded-corners` (for a `{tabular}`).

```
472 \bool_new:N \l_@@_hvlines_bool
```

The following flag will be used by (for instance) `\@@_vline_i{..}`. When `\l_@@_dotted_bool` is `true`, a dotted line (with our system) will be drawn.

```
473 \bool_new:N \l_@@_dotted_bool
```

The following flag will be set to true during the composition of a caption specified (by the key `caption`).

```
474 \bool_new:N \l_@@_in_caption_bool
```

Variables for the exterior rows and columns

The keys for the exterior rows and columns are `first-row`, `first-col`, `last-row` and `last-col`. However, internally, these keys are not coded in a similar way.

- **First row**

The integer `\l_@@_first_row_int` is the number of the first row of the array. The default value is 1, but, if the option `first-row` is used, the value will be 0.

```
475   \int_new:N \l_@@_first_row_int
476   \int_set_eq:NN \l_@@_first_row_int \c_one_int
```

- **First column**

The integer `\l_@@_first_col_int` is the number of the first column of the array. The default value is 1, but, if the option `first-col` is used, the value will be 0.

```
477   \int_new:N \l_@@_first_col_int
478   \int_set_eq:NN \l_@@_first_col_int \c_one_int
```

- **Last row**

The counter `\l_@@_last_row_int` is the number of the potential “last row”, as specified by the key `last-row`. A value of -2 means that there is no “last row”. A value of -1 means that there is a “last row” but we don’t know the number of that row (the key `last-row` has been used without value and the actual value has not still been read in the `aux` file).

```
479   \int_new:N \l_@@_last_row_int
480   \int_set:Nn \l_@@_last_row_int { -2 }
```

If, in an environment like `{pNiceArray}`, the option `last-row` is used without value, we will globally raise the following flag. It will be used to know if we have, after the construction of the array, to write in the `aux` file the number of the “last row”.³

```
481   \bool_new:N \l_@@_last_row_without_value_bool
```

Idem for `\l_@@_last_col_without_value_bool`

```
482   \bool_new:N \l_@@_last_col_without_value_bool
```

- **Last column**

For the potential “last column”, we use an integer. A value of -2 means that there is no last column. A value of -1 means that we are in an environment without preamble (e.g. `{bNiceMatrix}`) and there is a last column but we don’t know its value because the user has used the option `last-col` without value. A value of 0 means that the option `last-col` has been used in an environment with preamble (like `{pNiceArray}`): in this case, the key was necessary without argument. The command `\NiceMatrixOptions` also sets `\l_@@_last_col_int` to 0.

```
483   \int_new:N \l_@@_last_col_int
484   \int_set:Nn \l_@@_last_col_int { -2 }
```

However, we have also a boolean. Consider the following code:

³We can’t use `\l_@@_last_row_int` for this usage because, if `nicematrix` has read its value from the `aux` file, the value of the counter won’t be -1 any longer.

```

\begin{pNiceArray}{cc}[last-col]
1 & 2 \\
3 & 4
\end{pNiceArray}

```

In such a code, the “last column” specified by the key `last-col` is not used. We want to be able to detect such a situation and we create a boolean for that job.

```
485 \bool_new:N \g_@@_last_col_found_bool
```

This boolean is set to `false` at the end of `\@@_pre_array_ii::`.

In the last column, we will raise the following flag (it will be used by `\OnlyMainNiceMatrix`).

```
486 \bool_new:N \l_@@_in_last_col_bool
```

Some utilities

```
487 \cs_new_protected:Npn \@@_cut_on_hyphen:w #1-#2 \q_stop
488 {
```

Here, we use `\def` instead of `\tl_set:Nn` for efficiency only.

```
489 \def \l_tmpa_tl { #1 }
490 \def \l_tmpb_tl { #2 }
491 }
```

The following takes as argument the name of a `clist` and which should be a list of intervals of integers. It *expands* that list, that is to say, it replaces (by a sort of `mapcan` or `flat_map`) the interval by the explicit list of the integers.

```
492 \cs_new_protected:Npn \@@_expand_clist:N #1
493 {
494     \clist_if_in:NnF #1 { all }
495     {
496         \clist_clear:N \l_tmpa_clist
497         \clist_map_inline:Nn #1
498         {
```

We recall that `\tl_if_in:nnTF` is slightly faster than `\str_if_in:nnTF`.

```
499 \tl_if_in:nnTF { ##1 } { - }
500     { \@@_cut_on_hyphen:w ##1 \q_stop }
501 }
```

Here, we use `\def` instead of `\tl_set:Nn` for efficiency only.

```
502 \def \l_tmpa_tl { ##1 }
503 \def \l_tmpb_tl { ##1 }
504 }
505 \int_step_inline:nnn { \l_tmpa_tl } { \l_tmpb_tl }
506     { \clist_put_right:Nn \l_tmpa_clist { ####1 } }
507 }
508 \tl_set_eq:NN #1 \l_tmpa_clist
509 }
510 }
```

The following internal parameters are for:

- `\Ldots` with both extremities open (and hence also `\Hdotsfor` in an exterior row);
- when the special character “`:`” is used in order to put the label of a so-called “dotted line” *on the line*, a margin of `\c_@@_innersep_middle_dim` will be added around the label.

```
511 \hook_gput_code:nnn { begindocument } { . }
512 {
513     \dim_const:Nn \c_@@_shift_Ldots_last_row_dim { 0.5 em }
514     \dim_const:Nn \c_@@_innersep_middle_dim { 0.17 em }
515 }
```

5 The command \tabularnote

Of course, it's possible to use `\tabularnote` in the main tabular. But there is also the possibility to use that command in the caption of the tabular. And the caption may be specified by two means:

- The caption may of course be provided by the command `\caption` in a floating environment. Of course, a command `\tabularnote` in that `\caption` makes sens only if the `\caption` is *before* the `{tabular}`.
- It's also possible to use `\tabularnote` in the value of the key `caption` of the `{NiceTabular}` when the key `caption-above` is in force. However, in that case, one must remind that the caption is composed *after* the composition of the box which contains the main tabular (that's mandatory since that caption must be wrapped with a line width equal to the width of the tabular). However, we want the labels of the successive tabular notes in the logical order. That's why:
 - The number of tabular notes present in the caption will be written on the aux file and available in `\g_@@_notes_caption_int`.⁴
 - During the composition of the main tabular, the tabular notes will be numbered from `\g_@@_notes_caption_int+1` and the notes will be stored in `\g_@@_notes_seq`. Each component of `\g_@@_notes_seq` will be a kind of couple of the form : `{label}{text of the tabularnote}`. The first component is the optional argument (between square brackets) of the command `\tabularnote` (if the optional argument is not used, the value will be the special marker expressed by `\c_novalue_t1`).
 - During the composition of the caption (value of `\l_@@_caption_t1`), the tabular notes will be numbered from 1 to `\g_@@_notes_caption_int` and the notes themselves will be stored in `\g_@@_notes_in_caption_seq`. The structure of the components of that sequence will be the same as for `\g_@@_notes_seq`.
 - After the composition of the main tabular and after the composition of the caption, the sequences `\g_@@_notes_in_caption_seq` and `\g_@@_notes_seq` will be merged (in that order) and the notes will be composed.

The LaTeX counter `tabularnote` will be used to count the tabular notes during the construction of the array (this counter won't be used during the composition of the notes at the end of the array). You use a LaTeX counter because we will use `\refstepcounter` in order to have the tabular notes referenceable.

516 `\newcounter { tabularnote }`

We want to avoid error messages for duplicate labels when the package `hyperref` is used. That's why we will count all the tabular notes of the whole document with `\g_@@_tabularnote_int`.

517 `\int_new:N \g_@@_tabularnote_int`
518 `\cs_set:Npn \theHtabularnote { \int_use:N \g_@@_tabularnote_int }`
519 `\seq_new:N \g_@@_notes_seq`
520 `\seq_new:N \g_@@_notes_in_caption_seq`

Before the actual tabular notes, it's possible to put a text specified by the key `tabularnote` of the environment. The token list `\g_@@_tabularnote_t1` corresponds to the value of that key.

521 `\tl_new:N \g_@@_tabularnote_t1`

We prepare the tools for the formatting of the references of the footnotes (in the tabular itself). There may have several references of footnote at the same point and we have to take into account that point.

522 `\seq_new:N \l_@@_notes_labels_seq`
523 `\newcounter { nicematrix_draft }`

⁴More precisely, it's the number of tabular notes which do not use the optional argument of `\tabularnote`.

```

524 \cs_new_protected:Npn \@@_notes_format:n #1
525 {
526     \setcounter { nicematrix_draft } { #1 }
527     \@@_notes_style:n { nicematrix_draft }
528 }

```

The following function can be redefined by using the key `notes/style`.

```

529 \cs_new:Npn \@@_notes_style:n #1 { \textit { \alph { #1 } } }

```

The following function can be redefined by using the key `notes/label-in-tabular`.

```

530 \cs_new:Npn \@@_notes_label_in_tabular:n #1 { \textsuperscript { #1 } }

```

The following function can be redefined by using the key `notes/label-in-list`.

```

531 \cs_new:Npn \@@_notes_label_in_list:n #1 { \textsuperscript { #1 } }

```

We define `\thetabularnote` because it will be used by LaTeX if the user want to reference a tabular which has been marked by a `\label`. The TeX group is for the case where the user has put an instruction such as `\color{red}` in `\@@_notes_style:n`.

```

532 \cs_set:Npn \thetabularnote { \@@_notes_style:n { tabularnote } }

```

The tabular notes will be available for the final user only when `enumitem` is loaded. Indeed, the tabular notes will be composed at the end of the array with a list customized by `enumitem` (a list `tabularnotes` in the general case and a list `tabularnotes*` if the key `para` is in force). However, we can test whether `enumitem` has been loaded only at the beginning of the document (we want to allow the user to load `enumitem` after `nicematrix`).

```

533 \hook_gput_code:nnn { begindocument } { . }
534 {
535     \IfPackageLoadedTF { enumitem }
536     {

```

The type of list `tabularnotes` will be used to format the tabular notes at the end of the array in the general case and `tabularnotes*` will be used if the key `para` is in force.

```

537     \newlist { tabularnotes } { enumerate } { 1 }
538     \setlist [ tabularnotes ]
539     {
540         topsep = \c_zero_dim ,
541         noitemsep ,
542         leftmargin = * ,
543         align = left ,
544         labelsep = \c_zero_dim ,
545         label =
546             \@@_notes_label_in_list:n { \@@_notes_style:n { tabularnotesi } } ,
547     }
548     \newlist { tabularnotes* } { enumerate* } { 1 }
549     \setlist [ tabularnotes* ]
550     {
551         afterlabel = \nobreak ,
552         itemjoin = \quad ,
553         label =
554             \@@_notes_label_in_list:n { \@@_notes_style:n { tabularnotes*i } }
555     }

```

One must remind that we have allowed a `\tabular` in the caption and that caption may also be found in the list of tables (`\listoftables`). We want the command `\tabularnote` be no-op during the composition of that list. That's why we program `\tabularnote` to be no-op excepted in a floating environment or in an environment of `nicematrix`.

```

556 \NewDocumentCommand \tabularnote { o m }
557 {
558     \bool_lazy_or:nnT { \cs_if_exist_p:N \capttype } { \l_@@_in_env_bool }

```

```

559     {
560         \bool_lazy_and:nTF { ! \l_@@_tabular_bool } { \l_@@_in_env_bool }
561             { \@@_error:n { tabularnote~forbidden } }
562             {
563                 \bool_if:NTF \l_@@_in_caption_bool
564                     \@@_tabularnote_caption:nn
565                     \@@_tabularnote:nn
566                     { #1 } { #2 }
567             }
568         }
569     }
570 }
571 {
572     \NewDocumentCommand \tabularnote { o m }
573         { \@@_err_enumitem_not_loaded: }
574 }
575 }

576 \cs_new_protected:Npn \@@_err_enumitem_not_loaded:
577 {
578     \@@_error_or_warning:n { enumitem~not~loaded }
579     \cs_gset:Npn \@@_err_enumitem_not_loaded: { }
580 }

581 \cs_new_protected:Npn \@@_test_first_novalue:nnn #1 #2 #3
582     { \tl_if_novalue:nT { #1 } { #3 } }

```

For the version in normal conditions, that is to say not in the `caption`. #1 is the optional argument of `\tabularnote` (maybe equal to the special marker expressed by `\c_novalue_t1`) and #2 is the mandatory argument of `\tabularnote`.

```

583 \cs_new_protected:Npn \@@_tabularnote:nn #1 #2
584 {

```

You have to see whether the argument of `\tabularnote` has yet been used as argument of another `\tabularnote` in the same tabular. In that case, there will be only one note (for both commands `\tabularnote`) at the end of the tabular. We search the argument of our command `\tabularnote` in `\g_@@_notes_seq`. The position in the sequence will be stored in `\l_tmpa_int` (0 if the text is not in the sequence yet).

```

585     \int_zero:N \l_tmpa_int
586     \bool_if:NT \l_@@_notes_detect_duplicates_bool
587     {

```

We recall that each component of `\g_@@_notes_seq` is a kind of couple of the form

```
{label}{text of the tabularnote}.
```

If the user have used `\tabularnote` without the optional argument, the `label` will be the special marker expressed by `\c_novalue_t1`.

When we will go through the sequence `\g_@@_notes_seq`, we will count in `\l_tmpb_int` the notes without explicit label in order to have the “current” value of the counter `\c@tabularnote`.

```

588     \int_zero:N \l_tmpb_int
589     \seq_map_indexed_inline:Nn \g_@@_notes_seq

618                      { \l_tmpa_int }
619                  }
620              }
621          }
622          { #1 }
623      }
624      \peek_meaning:NF \tabularnote
625      {

```

If the following token is *not* a `\tabularnote`, we have finished the sequence of successive commands `\tabularnote` and we have to format the labels of these tabular notes (in the array). We compose those labels in a box `\l_tmpa_box` because we will do a special construction in order to have this box in an overlapping position if we are at the end of a cell when `\l_@@_hpos_cell_tl` is equal to `c` or `r`.

```

626      \hbox_set:Nn \l_tmpa_box
627      {

```

We remind that it is the command `\@@_notes_label_in_tabular:n` that will put the labels in a `\textsuperscript`.

```

628      \@@_notes_label_in_tabular:n
629      {
630          \seq_use:Nnnn
631          \l_@@_notes_labels_seq { , } { , } { , }
632      }
633  }
```

We want the (last) tabular note referenceable (with the standard command `\label`).

```

634      \int_gdecr:N \c@tabularnote
635      \int_set_eq:NN \l_tmpa_int \c@tabularnote
```

The following line is only to avoid error messages for multiply defined labels when the package `hyperref` is used.

```

636      \int_gincr:N \g_@@_tabularnote_int
637      \refstepcounter { tabularnote }
638      \int_compare:nNnT { \l_tmpa_int } = { \c@tabularnote }
639      { \int_gincr:N \c@tabularnote }
640      \seq_clear:N \l_@@_notes_labels_seq
641      \bool_lazy_or:mnTF
642      { \str_if_eq_p:ee \l_@@_hpos_cell_tl { c } }
643      { \str_if_eq_p:ee \l_@@_hpos_cell_tl { r } }
644      {
645          \hbox_overlap_right:n { \box_use:N \l_tmpa_box }
```

If the command `\tabularnote` is used exactly at the end of the cell, the `\unskip` (inserted by `array?`) will delete the skip we insert now and the label of the footnote will be composed in an overlapping position (by design).

```

646      \skip_horizontal:n { \box_wd:N \l_tmpa_box }
647      }
648      { \box_use:N \l_tmpa_box }
649  }
```

```
650 }
```

Now the version when the command is used in the key `caption`. The main difficulty is that the argument of the command `\caption` is composed several times. In order to know the number of commands `\tabularnote` in the caption, we will consider that there should not be the same tabular note twice in the caption (in the main tabular, it's possible). Once we have found a tabular note which has yet been encountered, we consider that you are in a new composition of the argument of `\caption`.

```
651 \cs_new_protected:Npn \@@_tabularnote_caption:nn #1 #2
652 {
653     \bool_if:NTF \g_@@_caption_finished_bool
654     {
655         \int_compare:nNnT { \c@tabularnote } = { \g_@@_notes_caption_int }
656         \int_gzero:N \c@tabularnote }
```

Now, we try to detect duplicate notes in the caption. Be careful! We must put `\tl_if_in:NnF` and not `\tl_if_in:NnT`:

```
657     \seq_if_in:NnF \g_@@_notes_in_caption_seq { { #1 } { #2 } }
658     { \@@_error:n { Identical~notes-in~caption } }
659 }
660 {
```

In the following code, we are in the first composition of the caption or at the first `\tabularnote` of the second composition.

```
661     \seq_if_in:NnTF \g_@@_notes_in_caption_seq { { #1 } { #2 } }
662     {
```

Now, we know that are in the second composition of the caption since we are reading a tabular note which has yet been read. Now, the value of `\g_@@_notes_caption_int` won't change anymore: it's the number of uses *without optional argument* of the command `\tabularnote` in the caption.

```
663         \bool_gset_true:N \g_@@_caption_finished_bool
664         \int_gset_eq:NN \g_@@_notes_caption_int \c@tabularnote
665         \int_gzero:N \c@tabularnote
666     }
667     { \seq_gput_right:Nn \g_@@_notes_in_caption_seq { { #1 } { #2 } } }
668 }
```

Now, we will compose the label of the footnote (in the caption). Even if we are not in the first composition, we have to compose that label!

```
669 \tl_if_novalue:nT { #1 } { \int_gincr:N \c@tabularnote }
670 \seq_put_right:Ne \l_@@_notes_labels_seq
671 {
672     \tl_if_novalue:nTF { #1 }
673     { \@@_notes_format:n { \int_use:N \c@tabularnote } }
674     { #1 }
675 }
676 \peek_meaning:NF \tabularnote
677 {
678     \@@_notes_label_in_tabular:n
679     { \seq_use:Nnnn \l_@@_notes_labels_seq { , } { , } { , } }
680     \seq_clear:N \l_@@_notes_labels_seq
681 }
682 }
683 \cs_new_protected:Npn \@@_count_novalue_first:nn #1 #2
684 { \tl_if_novalue:nT { #1 } { \int_gincr:N \g_@@_notes_caption_int } }
```

6 Command for creation of rectangle nodes

The following command should be used in a `{pgfpicture}`. It creates a rectangle (empty but with a name).

#1 is the name of the node which will be created; #2 and #3 are the coordinates of one of the corner of the rectangle; #4 and #5 are the coordinates of the opposite corner.

```

685 \cs_new_protected:Npn \@@_pgf_rect_node:nnnn #1 #2 #3 #4 #5
686 {
687     \begin{pgfscope}
688         \pgfset{
689             inner sep = \c_zero_dim ,
690             minimum size = \c_zero_dim
691         }
692         \pgftransformshift { \pgfpoint { 0.5 * ( #2 + #4 ) } { 0.5 * ( #3 + #5 ) } }
693         \pgfnode
694             { rectangle }
695             { center }
696             {
697                 \vbox_to_ht:nn
698                     { \dim_abs:n { #5 - #3 } }
699                     {
700                         \vfill
701                         \hbox_to_wd:nn { \dim_abs:n { #4 - #2 } } { }
702                     }
703             }
704             { #1 }
705             { }
706         \end{pgfscope}
707     }
708 }
```

The command `\@@_pgf_rect_node:nnn` is a variant of `\@@_pgf_rect_node:nnnn`: it takes two PGF points as arguments instead of the four dimensions which are the coordinates.

```

709 \cs_new_protected:Npn \@@_pgf_rect_node:nnn #1 #2 #3
710 {
711     \begin{pgfscope}
712         \pgfset{
713             inner sep = \c_zero_dim ,
714             minimum size = \c_zero_dim
715         }
716         \pgftransformshift { \pgfpointscale { 0.5 } { \pgfpointadd { #2 } { #3 } } }
717         \pgfpointdiff { #3 } { #2 }
718         \pgfgetlastxy \l_tmpa_dim \l_tmpb_dim
719         \pgfnode
720             { rectangle }
721             { center }
722             {
723                 \vbox_to_ht:nn
724                     { \dim_abs:n \l_tmpb_dim }
725                     { \vfill \hbox_to_wd:nn { \dim_abs:n \l_tmpa_dim } { } }
726             }
727             { #1 }
728             { }
729         \end{pgfscope}
730     }
731 }
```

7 The options

The following parameter corresponds to the keys `caption`, `short-caption` and `label` of the environment `{NiceTabular}`.

```
732 \tl_new:N \l_@_caption_tl
```

```

733 \tl_new:N \l_@@_short_caption_tl
734 \tl_new:N \l_@@_label_tl

```

The following parameter corresponds to the key `caption-above` of `\NiceMatrixOptions`. When this parameter is `true`, the captions of the environments `{NiceTabular}`, specified with the key `caption` are put above the tabular (and below elsewhere).

```
735 \bool_new:N \l_@@_caption_above_bool
```

By default, the behaviour of `\cline` is changed in the environments of `nicematrix`: a `\cline` spreads the array by an amount equal to `\arrayrulewidth`. It's possible to disable this feature with the key `\l_@@_standard_cline_bool`.

```
736 \bool_new:N \l_@@_standard_cline_bool
```

The following dimensions correspond to the options `cell-space-top-limit` and co (these parameters are inspired by the package `cellspace`).

```

737 \dim_new:N \l_@@_cell_space_top_limit_dim
738 \dim_new:N \l_@@_cell_space_bottom_limit_dim

```

The following parameter corresponds to the key `xdots/horizontal_labels`.

```
739 \bool_new:N \l_@@_xdots_h_labels_bool
```

The following dimension is the distance between two dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is `0.45 em` but it will be changed if the option `small` is used.

```

740 \dim_new:N \l_@@_xdots_inter_dim
741 \hook_gput_code:nnn { begindocument } { . }
742 { \dim_set:Nn \l_@@_xdots_inter_dim { 0.45 em } }

```

The unit is `em` and that's why we fix the dimension after the preamble.

The following dimension is the distance between a node (in fact an anchor of that node) and a dotted line (for real dotted lines, the actual distance may, of course, be a bit larger, depending of the exact position of the dots).

```

743 \dim_new:N \l_@@_xdots_shorten_start_dim
744 \dim_new:N \l_@@_xdots_shorten_end_dim
745 \hook_gput_code:nnn { begindocument } { . }
746 {
747     \dim_set:Nn \l_@@_xdots_shorten_start_dim { 0.3 em }
748     \dim_set:Nn \l_@@_xdots_shorten_end_dim { 0.3 em }
749 }

```

The unit is `em` and that's why we fix the dimension after the preamble.

The following dimension is the radius of the dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is `0.53 pt` but it will be changed if the option `small` is used.

```

750 \dim_new:N \l_@@_xdots_radius_dim
751 \hook_gput_code:nnn { begindocument } { . }
752 { \dim_set:Nn \l_@@_xdots_radius_dim { 0.53 pt } }

```

The unit is `em` and that's why we fix the dimension after the preamble.

The token list `\l_@@_xdots_line_style_tl` corresponds to the option `tikz` of the commands `\Cdots`, `\Ldots`, etc. and of the options `line-style` for the environments and `\NiceMatrixOptions`. The constant `\c_@@_standard_tl` will be used in some tests.

```

753 \tl_new:N \l_@@_xdots_line_style_tl
754 \tl_const:Nn \c_@@_standard_tl { standard }
755 \tl_set_eq:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl

```

The boolean `\l_@@_light_syntax_bool` corresponds to the option `light-syntax` and the boolean `\l_@@_light_syntax_expanded_bool` correspond to the the option `light-syntax-expanded`.

```
756 \bool_new:N \l_@@_light_syntax_bool
757 \bool_new:N \l_@@_light_syntax_expanded_bool
```

The string `\l_@@_baseline_tl` may contain one of the three values `t`, `c` or `b` as in the option of the environment `{array}`. However, it may also contain **an integer** (which represents the number of the row to which align the array).

```
758 \tl_new:N \l_@@_baseline_tl
759 \tl_set:Nn \l_@@_baseline_tl { c }
```

The following parameter corresponds to the key `ampersand-in-blocks`

```
760 \bool_new:N \l_@@_amp_in_blocks_bool
```

The flag `\l_@@_exterior_arraycolsep_bool` corresponds to the option `exterior-arraycolsep`. If this option is set, a space equal to `\arraycolsep` will be put on both sides of an environment `{NiceArray}` (as it is done in `{array}` of `array`).

```
761 \bool_new:N \l_@@_exterior_arraycolsep_bool
```

The flag `\l_@@_parallelize_diags_bool` controls whether the diagonals are parallelized. The initial value is `true`.

```
762 \bool_new:N \l_@@_parallelize_diags_bool
763 \bool_set_true:N \l_@@_parallelize_diags_bool
```

The following parameter correspond to the key `corners`. The elements of that `clist` must be within `NW`, `SW`, `NE` and `SE`.

```
764 \clist_new:N \l_@@_corners_clist
```

The flag `\l_@@_nullify_dots_bool` corresponds to the option `nullify-dots`. When the flag is down, the instructions like `\vdots` are inserted within a `\phantom` (and so the constructed matrix has exactly the same size as a matrix constructed with the classical `{matrix}` and `\ldots`, `\vdots`, etc.).

```
765 \bool_new:N \l_@@_nullify_dots_bool
```

When the key `respect-arraystretch` is used, the following command will be nullified.

```
766 \cs_new_protected:Npn \@@_reset_arraystretch: { \def \arraystretch { 1 } }
```

The following flag will be used when the current options specify that all the columns of the array must have the same width equal to the largest width of a cell of the array (except the cells of the potential exterior columns).

```
767 \bool_new:N \l_@@_auto_columns_width_bool
```

The following boolean corresponds to the key `create-cell-nodes` of the keyword `\CodeBefore`. When that key is used the “cell nodes” will be created before the `\CodeBefore` but, of course, they are *always* available in the main tabular and after!

```
768 \bool_new:N \g_@@_create_cell_nodes_bool
```

The string `\l_@@_name_str` will contain the optional name of the environment: this name can be used to access to the Tikz nodes created in the array from outside the environment.

```
769 \str_new:N \l_@@_name_str
```

The boolean `\l_@@_medium_nodes_bool` will be used to indicate whether the “medium nodes” are created in the array. Idem for the “large nodes”.

```
770 \bool_new:N \l_@@_medium_nodes_bool
771 \bool_new:N \l_@@_large_nodes_bool
```

The boolean `\l_@@_except_borders_bool` will be raised when the key `hvlines-except-borders` will be used (but that key has also other effects).

```
772 \bool_new:N \l_@@_except_borders_bool
```

The dimension `\l_@@_left_margin_dim` correspond to the option `left-margin`. Idem for the right margin. These parameters are involved in the creation of the “medium nodes” but also in the placement of the delimiters and the drawing of the horizontal dotted lines (`\hdottedline`).

```
773 \dim_new:N \l_@@_left_margin_dim
774 \dim_new:N \l_@@_right_margin_dim
```

The dimensions `\l_@@_extra_left_margin_dim` and `\l_@@_extra_right_margin_dim` correspond to the options `extra-left-margin` and `extra-right-margin`.

```
775 \dim_new:N \l_@@_extra_left_margin_dim
776 \dim_new:N \l_@@_extra_right_margin_dim
```

The token list `\l_@@_end_of_row_tl` corresponds to the option `end-of-row`. It specifies the symbol used to mark the ends of rows when the light syntax is used.

```
777 \tl_new:N \l_@@_end_of_row_tl
778 \tl_set:Nn \l_@@_end_of_row_tl { ; }
```

The following parameter is for the color the dotted lines drawn by `\Cdots`, `\Ldots`, `\Vdots`, `\Ddots`, `\Iddots` and `\Hdotsfor` but *not* the dotted lines drawn by `\hdottedline` and “`:`”.

```
779 \tl_new:N \l_@@_xdots_color_tl
```

The following token list corresponds to the key `delimiters/color`.

```
780 \tl_new:N \l_@@_delimiters_color_tl
```

Sometimes, we want to have several arrays vertically juxtaposed in order to have an alignment of the columns of these arrays. To achieve this goal, one may wish to use the same width for all the columns (for example with the option `columns-width` or the option `auto-columns-width` of the environment `{NiceMatrixBlock}`). However, even if we use the same type of delimiters, the width of the delimiters may be different from an array to another because the width of the delimiter is function of its size. That’s why we create an option called `delimiters/max-width` which will give to the delimiters the width of a delimiter (of the same type) of big size. The following boolean corresponds to this option.

```
781 \bool_new:N \l_@@_delimiters_max_width_bool
```

```
782 \keys_define:nn { nicematrix / xdots }

1189   sub-matrix .code:n = \keys_set:nn { nicematrix / sub-matrix } { #1 } ,
1190   sub-matrix .value_required:n = true ,
1191   unknown .code:n = \@@_error:n { Unknown-key-for-CodeAfter }
1192 }

```

8 Important code used by {NiceArrayWithDelims}

The pseudo-environment `\@@_cell_begin:-\@@_cell_end:` will be used to format the cells of the array. In the code, the affectations are global because this pseudo-environment will be used in the cells of a `\halign` (via an environment `{array}`).

```

1193 \cs_new_protected:Npn \@@_cell_begin:
1194 {

```

`\g_@@_cell_after_hook_tl` will be set during the composition of the box `\l_@@_cell_box` and will be used *after* the composition in order to modify that box.

```
1195 \tl_gclear:N \g_@@_cell_after_hook_tl
```

At the beginning of the cell, we link `\CodeAfter` to a command which do begin with `\\"` (whereas the standard version of `\CodeAfter` does not).

```
1196 \cs_set_eq:NN \CodeAfter \@@_CodeAfter_i:
```

We increment the LaTeX counter `jCol`, which is the counter of the columns.

```
1197 \int_gincr:N \c@jCol
```

Now, we increment the counter of the rows. We don't do this incrementation in the `\everycr` because some packages, like `arydshln`, create special rows in the `\halign` that we don't want to take into account.

```

1198 \int_compare:nNnT { \c@jCol } = { \c_one_int }
1199 {
1200   \int_compare:nNnT { \l_@@_first_col_int } = { \c_one_int }
1201   { \@@_begin_of_row: }
1202 }

```

The content of the cell is composed in the box `\l_@@_cell_box`. The `\hbox_set_end:` corresponding to this `\hbox_set:Nw` is in the `\@@_cell_end:`.

```
1203     \hbox_set:Nw \l_@@_cell_box
```

The following command is nullified in the tabulars.

```
1204     \@@_tuning_not_tabular_begin:
1205     \@@_tuning_first_row:
1206     \@@_tuning_last_row:
1207     \g_@@_row_style_tl
1208 }
```

The following command will be nullified unless there is a first row.

Here is a version with the standard syntax of L3.

```
\cs_new_protected:Npn \@@_tuning_first_row:
{
    \int_if_zero:nT { \c@iRow }
    {
        \int_if_zero:nF { \c@jCol }
        {
            \l_@@_code_for_first_row_tl
            \xglobal \colorlet { nicematrix-first-row } { . }
        }
    }
}
```

We will use a version a little more efficient.

```
1209 \cs_new_protected:Npn \@@_tuning_first_row:
1210 {
1211     \if_int_compare:w \c@iRow = \c_zero_int
1212     \if_int_compare:w \c@jCol > \c_zero_int
1213         \l_@@_code_for_first_row_tl
1214         \xglobal \colorlet { nicematrix-first-row } { . }
1215     \fi:
1216 \fi:
1217 }
```

The following command will be nullified unless there is a last row and we know its value (*i.e.* `\l_@@_lat_row_int > 0`).

```
\cs_new_protected:Npn \@@_tuning_last_row:
{
    \int_compare:nNnT { \c@iRow } = { \l_@@_last_row_int }
    {
        \l_@@_code_for_last_row_tl
        \xglobal \colorlet { nicematrix-last-row } { . }
    }
}
```

We will use a version a little more efficient.

```
1218 \cs_new_protected:Npn \@@_tuning_last_row:
1219 {
1220     \if_int_compare:w \c@iRow = \l_@@_last_row_int
1221         \l_@@_code_for_last_row_tl
1222         \xglobal \colorlet { nicematrix-last-row } { . }
1223     \fi:
1224 }
```

A different value will be provided to the following commands when the key `small` is in force.

```
1225 \cs_set_eq:NN \@@_tuning_key_small: \prg_do_nothing:
```

The following commands are nullified in the tabulars.

```

1226 \cs_set_nopar:Npn \@@_tuning_not_tabular_begin:
1227 {
1228   \m@th
1229   \c_math_toggle_token

```

A special value is provided by the following control sequence when the key `small` is in force.

```

1230   \@@_tuning_key_small:
1231 }
1232 \cs_set_eq:NN \@@_tuning_not_tabular_end: \c_math_toggle_token

```

The following macro `\@@_begin_of_row` is usually used in the cell number 1 of the row. However, when the key `first-col` is used, `\@@_begin_of_row` is executed in the cell number 0 of the row.

```

1233 \cs_new_protected:Npn \@@_begin_of_row:

We want to compute in `\g_@@_max_cell_width_dim` the width of the widest cell of the array (except the cells of the “first column” and the “last column”).

```
1335  \@@_update_max_cell_width:
```

The following computations are for the “first row” and the “last row”.

```
1336  \@@_update_for_first_and_last_row:
```

If the cell is empty, or may be considered as if, we must not create the PGF node, for two reasons:

- it’s a waste of time since such a node would be rather pointless;
- we test the existence of these nodes in order to determine whether a cell is empty when we search the extremities of a dotted line.

However, it’s difficult to determine whether a cell is empty. Up to now we use the following technique:

- for the columns of type `p`, `m`, `b`, `V` (of `varwidth`) or `X`, we test whether the cell is syntactically empty with `\@@_test_if_empty:` and `\@@_test_if_empty_for_S:`
- if the width of the box `\l_@@_cell_box` (created with the content of the cell) is equal to zero, we consider the cell as empty (however, this is not perfect since the user may have used a `\rlap`, `\llap`, `\clap` or a `\mathclap` of `mathtools`).
- the cells with a command `\Ldots` or `\Cdots`, `\Vdots`, etc., should also be considered as empty; if `nullify-dots` is in force, there would be nothing to do (in this case the previous commands only write an instruction in a kind of `\CodeAfter`); however, if `nullify-dots` is not in force, a phantom of `\ldots`, `\cdots`, `\vdots` is inserted and its width is not equal to zero; that’s why these commands raise a boolean `\g_@@_empty_cell_bool` and we begin by testing this boolean.

```

1337  \bool_if:NTF \g_@@_empty_cell_bool
1338  { \box_use_drop:N \l_@@_cell_box }
1339  {
1340  \bool_if:NTF \g_@@_not_empty_cell_bool
1341  { \@@_print_node_cell: }

1367     { \hbox_unpack_drop:N \l_@@_cell_box }
1368   }
1369 }
1370 \@@_cell_end_i:
1371 }

1372 \pgfset
1373 {
1374   nicematrix / cell-node /.style =
1375   {
1376     inner_sep = \c_zero_dim ,
1377     minimum_width = \c_zero_dim
1378   }
1379 }

```

In the cells of a column of type S (of `siunitx`), we have to wrap the command `\@@_node_cell`: inside a command of `siunitx` to enforce the correct horizontal alignment. In the cells of the columns with other columns type, we don't have to do that job. That's why we create a socket with its default plug (`identity`) and a plug when we have to do the wrapping.

```

1380 \socket_new:nn { nicematrix / siunitx-wrap } { 1 }
1381 \socket_new_plug:nnn { nicematrix / siunitx-wrap } { active }
1382 {
1383   \use:c
1384   {
1385     __siunitx_table_align_
1386     \bool_if:NTF \l_siunitx_table_text_bool
1387     { \l_siunitx_table_align_text_tl }
1388     { \l_siunitx_table_align_number_tl }
1389   :n
1390 }
1391 { #1 }
1392 }

```

Now, a socket which deal with `create-cell-nodes` of the keyword `\CodeBefore`. When that key is used the "cell nodes" will be created before the `\CodeBefore` but, of course, they are *always* available in the main tabular and after!

```

1393 \socket_new:nn { nicematrix / create-cell-nodes } { 1 }
1394 \socket_new_plug:nnn { nicematrix / create-cell-nodes } { active }
1395 {

If `booktabs` is loaded, we have to patch the macro `\@BTnormal` which is a macro of `booktabs`. The macro `\@BTnormal` draws an horizontal rule but it occurs after a vertical skip done by a low level TeX command. When this macro `\@BTnormal` occurs, the `row` node has yet been inserted by `nicematrix` before the vertical skip (and thus, at a wrong place). That's why we decide to create a new `row` node (for the same row). We patch the macro `\@BTnormal` to create this `row` node. This new `row` node will overwrite the previous definition of that `row` node and we have managed to avoid the error messages of that redefinition⁵.

```

1539 \hook_gput_code:nnn { begindocument } { . }

1547 }
```

The box `\@arstrutbox` is a box constructed in the beginning of the environment `{array}`. The construction of that box takes into account the current value of `\arraystretch`⁶ and `\extrarowheight` (of `array`). That box is inserted (via `\@arstrut`) in the beginning of each row of the array. That's why we use the dimensions of that box to initialize the variables which will be the dimensions of the potential first and last row of the environment. This initialization must be done after the creation of `\@arstrutbox` and that's why we do it in the `\ialign`.

```

If the option `small` is used, we have to do some tuning. In particular, we change the value of `\arraystretch` (this parameter is used in the construction of `\@arstrutbox` in the beginning of `{array}`).

```

1567 \bool_if:NT \l_@@_small_bool
1568 {
1569   \def \arraystretch { 0.47 }
1570   \dim_set:Nn \arraycolsep { 1.45 pt }
```

⁵cf. `\nicematrix@redefine@check@rerun`

⁶The option `small` of `nicematrix` changes (among others) the value of `\arraystretch`. This is done, of course, before the call of `{array}`.

By default, `\@@_tuning_key_small`: is no-op.

```
1571     \cs_set_eq:NN \@@_tuning_key_small: \scriptstyle
1572 }
```

The boolean `\g_@@_create_cell_nodes_bool` corresponds to the key `create-cell-nodes` of the keyword `\CodeBefore`. When that key is used the “cell nodes” will be created before the `\CodeBefore` but, of course, they are *always* available in the main tabular and after!

```
1573     \bool_if:NT \g_@@_create_cell_nodes_bool
1574     {
1575         \tl_put_right:Nn \@@_begin_of_row:
1576         {
1577             \pgf@sys@markposition
1578             { \@@_env: - row - \int_use:N \c@iRow - base }
1579         }
1580         \socket_assign_plugin:nn { nicematrix / create-cell-nodes } { active }
1581     }
```

The environment `{array}` (since version 2.6) uses internally the command `\ar@ialign` (and previously, it was `\ialign`). We change that command for several reasons. In particular, `\ar@ialign` sets `\everycr` to `{ }` and we *need* to change the value of `\everycr`.

```
1582     \bool_if:NT \c_@@_recent_array_bool
1583     {
1584         \bool_if:NF \c_@@_revtex_bool
1585         {
1586             \def \ar@ialign
1587             {
1588                 \bool_if:NT \c_@@_testphase_table_bool
1589                     \tbl_init_cell_data_for_table:
1590                     \@@_some_initialization:
1591                     \dim_zero:N \tabskip
```

After its first use, the definition of `\ar@ialign` will revert automatically to its default definition. With this programmation, we will have, in the cells of the array, a clean version of `\ar@ialign`. We use `\cs_set_eq:Nc` instead of `\cs_set_eq:NN` in order to avoid a message when `explcheck` is used on `nicematrix.sty`.

```
1592             \cs_set_eq:Nc \ar@ialign { @@_old_ar@ialign: }
1593             \halign
1594             }
1595         }
1596     }
```

The following part should be deleted when we will delete the boolean `\c_@@_recent_array_bool` (when we consider the version 2.6a of `array` is required). Moreover, `revtex4-2` modifies `array` and provides commands which are meant to be the standard version of `array` but, at the date of november 2024, these commands corresponds to the *old* version of `array`, that is to say without the `\ar@ialign`.

```
1597     {
1598         \def \ialign
1599         {
1600             \@@_some_initialization:
1601             \dim_zero:N \tabskip
1602             \cs_set_eq:NN \ialign \@@_old_ialign:
1603             \halign
1604         }
1605     }
```

It seems that there is a problem when `nicematrix` is used with `revtex4-2` with the package `colortbl` loaded. The following code prevent that problem but it does *not* treat the actual problem! It's only a patch *ad hoc*.

That patch has been added in version 7.0x, 2024-11-27 (question by mail of Tamra Nebabu).

```
1606     \bool_if:NT \c_@@_revtex_bool
1607     {
```

```

1608     \IfPackageLoadedT { colortbl }
1609     { \cs_set_protected:Npn \CT@setup { } }
1610 }

```

We keep in memory the old versions of `\ldots`, `\cdots`, etc. only because we use them inside `\phantom` commands in order that the new commands `\Ldots`, `\Cdots`, etc. give the same spacing (except when the option `nullify-dots` is used).

```

We redefine `\multicolumn` and, since we want `\multicolumn` to be available in the potential environments `{tabular}` nested in the environments of `nicematrix`, we patch `{tabular}` to go back to the original definition. A `\hook_gremove_code:nn` will be put in `\@@_after_array`:

```

1652     \cs_set_eq:NN \multicolumn \@@_multicolumn:nnn
1653     \hook_gput_code:nnn { env / tabular / begin } { nicematrix }
1654     { \cs_set_eq:NN \multicolumn \@@_old_multicolumn: }
1655     \@@_revert_colortbl:

```

If there is one or several commands `\tabularnote` in the caption specified by the key `caption` and if that caption has to be composed above the tabular, we have now that information because it has been written in the aux file at a previous run. We use that information to start counting the tabular notes in the main array at the right value (we remember that the caption will be composed *after* the array!).

```

1656     \tl_if_exist:NT \l_@@_note_in_caption_tl
1657     {

```

```

1658 \tl_if_empty:NF \l_@@_note_in_caption_tl
1659 {
1660     \int_gset_eq:NN \g_@@_notes_caption_int \l_@@_note_in_caption_tl
1661     \int_gset:Nn \c@tabularnote { \l_@@_note_in_caption_tl }
1662 }
1663 }
```

The sequence `\g_@@_multicolumn_cells_seq` will contain the list of the cells of the array where a command `\multicolumn{n}{...}{...}` with $n > 1$ is issued. In `\g_@@_multicolumn_sizes_seq`, the “sizes” (that is to say the values of n) correspondent will be stored. These lists will be used for the creation of the “medium nodes” (if they are created).

```

1664 \seq_gclear:N \g_@@_multicolumn_cells_seq
1665 \seq_gclear:N \g_@@_multicolumn_sizes_seq
```

The counter `\c@iRow` will be used to count the rows of the array (its incrementation will be in the first cell of the row).

```
1666 \int_gset:Nn \c@iRow { \l_@@_first_row_int - 1 }
```

At the end of the environment `{array}`, `\c@iRow` will be the total number de rows.

`\g_@@_row_total_int` will be the number or rows excepted the last row (if `\l_@@_last_row_bool` has been raised with the option `last-row`).

```
1667 \int_gzero_new:N \g_@@_row_total_int
```

The counter `\c@jCol` will be used to count the columns of the array. Since we want to know the total number of columns of the matrix, we also create a counter `\g_@@_col_total_int`. These counters are updated in the command `\@@_cell_begin:` executed at the beginning of each cell.

```

1668 \int_gzero_new:N \g_@@_col_total_int
1669 \cs_set_eq:NN \c@ifnextchar \new@ifnextchar
1670 \bool_gset_false:N \g_@@_last_col_found_bool
```

During the construction of the array, the instructions `\Cdots`, `\Ldots`, etc. will be written in token lists `\g_@@_Cdots_lines_tl`, etc. which will be executed after the construction of the array.

```

1671 \tl_gclear_new:N \g_@@_Cdots_lines_tl
1672 \tl_gclear_new:N \g_@@_Ldots_lines_tl
1673 \tl_gclear_new:N \g_@@_Vdots_lines_tl
1674 \tl_gclear_new:N \g_@@_Ddots_lines_tl
1675 \tl_gclear_new:N \g_@@_Iddots_lines_tl
1676 \tl_gclear_new:N \g_@@_HVdotsfor_lines_tl

1677 \tl_gclear:N \g_nicematrix_code_before_tl
1678 \tl_gclear:N \g_@@_pre_code_before_tl
1679 }
```

This is the end of `\@@_pre_array_ii:`.

The command `\@@_pre_array:` will be executed after analyse of the keys of the environment.

```

1680 \cs_new_protected:Npn \@@_pre_array:

1683     \int_gzero_new:N \c@iRow
1684     \cs_if_exist:NT \thejCol { \int_set_eq:NN \l_@@_old_jCol_int \c@jCol }
1685     \int_gzero_new:N \c@jCol
```

We recall that `\l_@@_last_row_int` and `\l_@@_last_column_int` are *not* the numbers of the last row and last column of the array. There are only the values of the keys `last-row` and `last-column` (maybe the user has provided erroneous values). The meaning of that counters does not change during the environment `nicematrix`. There is only a slight adjustment: if the user have used one of those keys without value, we provide now the right value as read on the `aux` file (of course, it's possible only after the first compilation).

```

1686 \int_compare:nNnT { \l_@@_last_row_int } = { -1 }
1687 {
1688     \bool_set_true:N \l_@@_last_row_without_value_bool
```

```

1689     \bool_if:NT \g_@@_aux_found_bool
1690         { \int_set:Nn \l_@@_last_row_int { \seq_item:Nn \g_@@_size_seq { 3 } } }
1691     }
1692 \int_compare:nNnT { \l_@@_last_col_int } = { -1 }
1693 {
1694     \bool_if:NT \g_@@_aux_found_bool
1695         { \int_set:Nn \l_@@_last_col_int { \seq_item:Nn \g_@@_size_seq { 6 } } }
1696 }

```

If there is an exterior row, we patch a command used in `\@@_cell_begin:` in order to keep track of some dimensions needed to the construction of that “last row”.

```

1697 \int_compare:nNnT { \l_@@_last_row_int } > { -2 }
1698 {
1699     \tl_put_right:Nn \@@_update_for_first_and_last_row:
1700     {
1701         \dim_compare:nNnT { \g_@@_ht_last_row_dim } < { \box_ht:N \l_@@_cell_box }
1702             { \dim_gset:Nn \g_@@_ht_last_row_dim { \box_ht:N \l_@@_cell_box } }
1703         \dim_compare:nNnT { \g_@@_dp_last_row_dim } < { \box_dp:N \l_@@_cell_box }
1704             { \dim_gset:Nn \g_@@_dp_last_row_dim { \box_dp:N \l_@@_cell_box } }
1705     }
1706 }

1707 \seq_gclear:N \g_@@_cols_vlism_seq
1708 \seq_gclear:N \g_@@_submatrix_seq

```

Now the `\CodeBefore`.

```
1709 \bool_if:NT \l_@@_code_before_bool { \@@_exec_code_before: }
```

The value of `\g_@@_pos_of_blocks_seq` has been written on the aux file and loaded before the (potential) execution of the `\CodeBefore`. Now, we clear that variable because it will be reconstructed during the creation of the array.

```
1710 \seq_gset_eq:NN \g_@@_pos_of_blocks_seq \g_@@_future_pos_of_blocks_seq
1711 \seq_gclear:N \g_@@_future_pos_of_blocks_seq
```

Idem for other sequences written on the aux file.

```
1712 \seq_gclear_new:N \g_@@_multicolumn_cells_seq
1713 \seq_gclear_new:N \g_@@_multicolumn_sizes_seq
```

The command `\create_row_node:` will create a row-node (and not a row of nodes!). However, at the end of the array we construct a “false row” (for the col-nodes) and it interferes with the construction of the last row-node of the array. We don’t want to create such row-node twice (to avoid warnings or, maybe, errors). That’s why the command `\@@_create_row_node:` will use the following counter to avoid such construction.

```
1714 \int_gset:Nn \g_@@_last_row_node_int { -2 }
```

The value -2 is important.

The code in `\@@_pre_array_ii:` is used only here.

```
1715 \@@_pre_array_ii:
```

The array will be composed in a box (named `\l_@@_the_array_box`) because we have to do manipulations concerning the potential exterior rows.

```
1716 \box_clear_new:N \l_@@_the_array_box
```

We compute the width of both delimiters. We remind that, when the environment `{NiceArray}` is used, it’s possible to specify the delimiters in the preamble (eg `[ccc]`).

```

1717 \dim_zero_new:N \l_@@_left_delim_dim
1718 \dim_zero_new:N \l_@@_right_delim_dim
1719 \bool_if:NTF \g_@@_delims_bool
1720 {

```

The command `\bBigg@` is a command of `amsmath`.

```

1721 \hbox_set:Nn \l_tmpa_box { $ \bBigg@ 5 \g_@@_left_delim_tl $ }
1722 \dim_set:Nn \l_@@_left_delim_dim { \box_wd:N \l_tmpa_box }
1723 \hbox_set:Nn \l_tmpa_box { $ \bBigg@ 5 \g_@@_right_delim_tl $ }
1724 \dim_set:Nn \l_@@_right_delim_dim { \box_wd:N \l_tmpa_box }
1725 }
1726 {
1727     \dim_gset:Nn \l_@@_left_delim_dim
1728         { 2 \bool_if:NTF \l_@@_tabular_bool { \tabcolsep } { \arraycolsep } }
1729     \dim_gset_eq:NN \l_@@_right_delim_dim \l_@@_left_delim_dim
1730 }
```

Here is the beginning of the box which will contain the array. The `\hbox_set_end:` corresponding to this `\hbox_set:Nw` will be in the second part of the environment (and the closing `\c_math_toggle_token` also).

```

1731 \hbox_set:Nw \l_@@_the_array_box
1732 \skip_horizontal:N \l_@@_left_margin_dim
1733 \skip_horizontal:N \l_@@_extra_left_margin_dim
1734 \bool_if:NT \c_@@_recent_array_bool
1735     { \UseTaggingSocket { \begin{tbl / hmode } } }
```

The following code is a workaround to specify to the tagging system that the following code is *fake math* (it raises `\l__math_fakemath_bool` in recent versions of LaTeX).

```

1736 \m@th
1737 \c_math_toggle_token
1738 \bool_if:NTF \l_@@_light_syntax_bool
1739     { \use:c { @@-light-syntax } }
1740     { \use:c { @@-normal-syntax } }
1741 }
```

The following command `\@@_CodeBefore_Body:w` will be used when the keyword `\CodeBefore` is present at the beginning of the environment.

```

1742 \cs_new_protected_nopar:Npn \@@_CodeBefore_Body:w #1 \Body
1743 {
1744     \tl_set:Nn \l_tmpa_tl { #1 }
1745     \int_compare:nNnT { \char_value_catcode:n { 60 } } = { 13 }
1746         { \@@_rescan_for_spanish:N \l_tmpa_tl }
1747     \tl_gput_left:No \g_@@_pre_code_before_tl \l_tmpa_tl
1748     \bool_set_true:N \l_@@_code_before_bool
```

We go on with `\@@_pre_array:` which will (among other) execute the `\CodeBefore` (specified in the key `code-before` or after the keyword `\CodeBefore`). By definition, the `\CodeBefore` must be executed before the body of the array...

```

1749 \@@_pre_array:
1750 }
```

9 The `\CodeBefore`

The following command will be executed if the `\CodeBefore` has to be actually executed (that command will be used only once and is present alone only for legibility).

```

1751 \cs_new_protected:Npn \@@_pre_code_before:
1752 {
```

First, we give values to the LaTeX counters `iRow` and `jCol`. We remind that, in the `\CodeBefore` (and in the `\CodeAfter`) they represent the numbers of rows and columns of the array (without the potential last row and last column). The value of `\g_@@_row_total_int` is the number of the last row (with potentially a last exterior row) and `\g_@@_col_total_int` is the number of the last column (with potentially a last exterior column).

```
1753 \int_set:Nn \c@iRow { \seq_item:Nn \g_@@_size_seq { 2 } }
1754 \int_set:Nn \c@jCol { \seq_item:Nn \g_@@_size_seq { 5 } }
1755 \int_set:Nn \g_@@_row_total_int { \seq_item:Nn \g_@@_size_seq { 3 } }
1756 \int_set:Nn \g_@@_col_total_int { \seq_item:Nn \g_@@_size_seq { 6 } }
```

Now, we will create all the `col` nodes and `row` nodes with the information written in the `aux` file. You use the technique described in the page 1247 of `pgfmanual.pdf`, version 3.1.10.

```
1757 \pgfsys@markposition { \@@_env: - position }
1758 \pgfsys@getposition { \@@_env: - position } \@@_picture_position:
1759 \pgfpicture
1760 \pgf@relevantforpicturesizefalse
```

First, the recreation of the `row` nodes.

```
1761 \int_step_inline:nnn { \l_@@_first_row_int } { \g_@@_row_total_int + 1 }
1762 {
1763     \pgfsys@getposition { \@@_env: - row - ##1 } \@@_node_position:
1764     \pgfcoordinate { \@@_env: - row - ##1 }
1765         { \pgfpointdiff \@@_picture_position: \@@_node_position: }
1766 }
```

Now, the recreation of the `col` nodes.

```
1767 \int_step_inline:nnn { \l_@@_first_col_int } { \g_@@_col_total_int + 1 }
1768 {
1769     \pgfsys@getposition { \@@_env: - col - ##1 } \@@_node_position:
1770     \pgfcoordinate { \@@_env: - col - ##1 }
1771         { \pgfpointdiff \@@_picture_position: \@@_node_position: }
1772 }
```

Now, you recreate the diagonal nodes by using the `row` nodes and the `col` nodes.

```
1773 \@@_create_diag_nodes:
```

Now, the creation of the cell nodes ($i-j$), and, maybe also the “medium nodes” and the “large nodes”.

```
1774 \bool_if:NT \g_@@_create_cell_nodes_bool { \@@_recreate_cell_nodes: }
1775 \endpgfpicture
```

Now, the recreation of the nodes of the blocks *which have a name*.

```
1776 \@@_create_blocks_nodes:
1777 \IfPackageLoadedT { tikz }
1778 {
1779     \tikzset
1780     {
1781         every~picture / .style =
1782             { overlay , name-prefix = \@@_env: - }
1783     }
1784 }
1785 \cs_set_eq:NN \cellcolor \@@_cellcolor
1786 \cs_set_eq:NN \rectanglecolor \@@_rectanglecolor

1792 \cs_set_eq:NN \columncolor \@@_columncolor
1793 \cs_set_eq:NN \chessboardcolors \@@_chessboardcolors
1794 \cs_set_eq:NN \SubMatrix \@@_SubMatrix_in_code_before
1795 \cs_set_eq:NN \ShowCellNames \@@_ShowCellNames
1796 \cs_set_eq:NN \TikzEveryCell \@@_TikzEveryCell
1797 \cs_set_eq:NN \EmptyColumn \@@_EmptyColumn:n
```

```

1798     \cs_set_eq:NN \EmptyRow \@@_EmptyRow:n
1799 }

```

```

1800 \cs_new_protected:Npn \@@_exec_code_before:
1801 {

```

We mark the cells which are in the (empty) corners because those cells must not be colored. We should try to find a way to detect whether we actually have coloring instructions to execute...

```

1802 \clist_map_inline:Nn \l_@@_corners_cells_clist
1803   { \cs_set_nopar:cpn { @@ _ corner _ ##1 } { } }
1804 \seq_gclear_new:N \g_@@_colors_seq

```

The sequence `\g_@@_colors_seq` will always contain as first element the special color `nocolor`: when that color is used, no color will be applied in the corresponding cells by the other coloring commands of `nicematrix`.

```

1805 \@@_add_to_colors_seq:nn { { nocolor } } { }
1806 \bool_gset_false:N \g_@@_create_cell_nodes_bool
1807 \group_begin:

```

We compose the `\CodeBefore` in math mode in order to nullify the spaces put by the user between instructions in the `\CodeBefore`.

```

1808 \if_mode_math:
1809   \@@_exec_code_before_i:
1810 \else:
1811   \c_math_toggle_token
1812   \@@_exec_code_before_i:
1813   \c_math_toggle_token
1814 \fi:
1815 \group_end:
1816 }

```

The following code is a security for the case the user has used `babel` with the option `spanish`: in that case, the characters < (de code ASCII 60) and > are activated and Tikz is not able to solve the problem (even with the Tikz library `babel`).

```

1817 \cs_new_protected:Npn \@@_exec_code_before_i:
1818 {
1819   \int_compare:nNnT { \char_value_catcode:n { 60 } } = { 13 }
1820   { \@@_rescan_for_spanish:N \l_@@_code_before_tl }

```

Here is the `\CodeBefore`. The construction is a bit complicated because `\g_@@_pre_code_before_tl` may begin with keys between square brackets. Moreover, after the analyze of those keys, we sometimes have to decide to do *not* execute the rest of `\g_@@_pre_code_before_tl` (when it is asked for the creation of cell nodes in the `\CodeBefore`). That's why we use a `\q_stop`: it will be used to discard the rest of `\g_@@_pre_code_before_tl`.

```

1821 \exp_last_unbraced:No \@@_CodeBefore_keys:
1822   \g_@@_pre_code_before_tl

```

Now, all the cells which are specified to be colored by instructions in the `\CodeBefore` will actually be colored. It's a two-stages mechanism because we want to draw all the cells with the same color at the same time to absolutely avoid thin white lines in some PDF viewers.

```

1823 \@@_actually_color:
1824   \l_@@_code_before_tl
1825   \q_stop
1826 }

```

```

1827 \keys_define:nn { nicematrix / CodeBefore }
1828 {
1829   create-cell-nodes .bool_gset:N = \g_@@_create_cell_nodes_bool ,
1830   create-cell-nodes .default:n = true ,
1831   sub-matrix .code:n = \keys_set:nn { nicematrix / sub-matrix } { #1 } ,
1832   sub-matrix .value_required:n = true ,

```

```

1833     delimiters / color .tl_set:N = \l_@@_delimiters_color_tl ,
1834     delimiters / color .value_required:n = true ,
1835     unknown .code:n = \@@_error:n { Unknown-key-for-CodeBefore }
1836 }
1837 \NewDocumentCommand \@@_CodeBefore_keys: { O { } }
1838 {
1839     \keys_set:nn { nicematrix / CodeBefore } { #1 }
1840     \@@_CodeBefore:w
1841 }

```

We have extracted the options of the keyword `\CodeBefore` in order to see whether the key `create-cell-nodes` has been used. Now, you can execute the rest of the `\CodeBefore`, excepted, of course, if we are in the first compilation.

```

1842 \cs_new_protected:Npn \@@_CodeBefore:w #1 \q_stop
1843 {
1844     \bool_if:NT \g_@@_aux_found_bool
1845     {
1846         \@@_pre_code_before:
1847         \legacy_if:nF { measuring@ } { #1 }
1848     }
1849 }

```

By default, if the user uses the `\CodeBefore`, only the `col` nodes, `row` nodes and `diag` nodes are available in that `\CodeBefore`. With the key `create-cell-nodes`, the cell nodes, that is to say the nodes of the form $(i-j)$ (but not the extra nodes) are also available because those nodes also are recreated and that recreation is done by the following command.

```

1850 \cs_new_protected:Npn \@@_recreate_cell_nodes:
1851 {
1852     \int_step_inline:nnn { \l_@@_first_row_int } { \g_@@_row_total_int }

1962   \bool_set_true:N \l_@@_in_env_bool

```

The command \CT@arc@ contains the instruction of color for the rules of the array⁸. This command is used by \CT@arc@ but we use it also for compatibility with colortbl. But we want also to be able to use color for the rules of the array when colortbl is *not* loaded. That's why we do the following instruction which is in the patch of the beginning of arrays done by colortbl. Of course, we restore the value of \CT@arc@ at the end of our environment.

```
1963 \cs_gset_eq:cN { @@_old_CT@arc@ } \CT@arc@
```

We deactivate Tikz externalization because we will use PGF pictures with the options `overlay` and `remember picture` (or equivalent forms). We deactivate with \tikzexternalisable and not with \tikzset{external/export=false} which is *not* equivalent.

```

1964 \cs_if_exist:NT \tikz@library@external@loaded
1965   {
1966     \tikzexternalisable
1967     \cs_if_exist:NT \ifstandalone
1968       { \tikzset { external / optimize = false } }
1969   }

```

We increment the counter \g_@@_env_int which counts the environments of the package.

```

1970 \int_gincr:N \g_@@_env_int
1971 \bool_if:NF \l_@@_block_auto_columns_width_bool
1972   { \dim_gzero_new:N \g_@@_max_cell_width_dim }

```

⁸e.g. \color[rgb]{0.5,0.5,0}

The sequence `\g_@@_blocks_seq` will contain the characteristics of the blocks (specified by `\Block`) of the array. The sequence `\g_@@_pos_of_blocks_seq` will contain only the position of the blocks.

```
1973 \seq_gclear:N \g_@@_blocks_seq
1974 \seq_gclear:N \g_@@_pos_of_blocks_seq
```

In fact, the sequence `\g_@@_pos_of_blocks_seq` will also contain the positions of the cells with a `\diagbox` and the `\multicolumn`.

```
1975 \seq_gclear:N \g_@@_pos_of_stroken_blocks_seq
1976 \seq_gclear:N \g_@@_pos_of_xdots_seq
1977 \tl_gclear_new:N \g_@@_code_before_tl
1978 \tl_gclear:N \g_@@_row_style_tl
```

We load all the information written in the `aux` file during previous compilations corresponding to the current environment.

```
1979 \tl_if_exist:cTF { g_@@_int_use:N \g_@@_env_int _ tl }
1980 {
1981     \bool_gset_true:N \g_@@_aux_found_bool
1982     \use:c { g_@@_int_use:N \g_@@_env_int _ tl }
1983 }
1984 { \bool_gset_false:N \g_@@_aux_found_bool }
```

Now, we prepare the token list for the instructions that we will have to write on the `aux` file at the end of the environment.

```
1985 \tl_gclear:N \g_@@_aux_tl
1986 \tl_if_empty:NF \g_@@_code_before_tl
1987 {
1988     \bool_set_true:N \l_@@_code_before_bool
1989     \tl_put_right:No \l_@@_code_before_tl \g_@@_code_before_tl
1990 }
1991 \tl_if_empty:NF \g_@@_pre_code_before_tl
1992 { \bool_set_true:N \l_@@_code_before_bool }
```

The set of keys is not exactly the same for `{NiceArray}` and for the variants of `{NiceArray}` (`{pNiceArray}`, `{bNiceArray}`, etc.) because, for `{NiceArray}`, we have the options `t`, `c`, `b` and `baseline`.

```
1993 \bool_if:NTF \g_@@_delims_bool
1994 { \keys_set:nn { nicematrix / pNiceArray } }
1995 { \keys_set:nn { nicematrix / NiceArray } }
1996 { #3 , #5 }

1997 \@@_set_CTarc:o \l_@@_rules_color_tl % noqa: w302
```

The argument `#6` is the last argument of `{NiceArrayWithDelims}`. With that argument of type “`t \CodeBefore`”, we test whether there is the keyword `\CodeBefore` at the beginning of the body of the environment. If that keyword is present, we have now to extract all the content between that keyword `\CodeBefore` and the (other) keyword `\Body`. It’s the job that will do the command `\@@_CodeBefore_Body:w`. After that job, the command `\@@_CodeBefore_Body:w` will go on with `\@@_pre_array:`.

```
1998 \bool_if:nTF { #6 } { \@@_CodeBefore_Body:w } { \@@_pre_array: }
```

Now, the second part of the environment `{NiceArrayWithDelims}`.

```
2000 {
2001     \bool_if:NTF \l_@@_light_syntax_bool
2002     { \use:c { end @-light-syntax } }
2003     { \use:c { end @-normal-syntax } }
2004     \c_math_toggle_token
2005     \skip_horizontal:N \l_@@_right_margin_dim
2006     \skip_horizontal:N \l_@@_extra_right_margin_dim
2007     \hbox_set_end:
2008     \bool_if:NT \c_@@_recent_array_bool
2009     { \UseTaggingSocket { tbl / hmode / end } }
```

End of the construction of the array (in the box `\l_@@_the_array_box`).

If the user has used the key `width` without any column X, we raise an error.

```

2010 \bool_if:NT \l_@@_width_used_bool
2011 {
2012     \fp_compare:nNnT { \g_@@_total_X_weight_fp } = { \c_zero_fp }
2013     { \@@_error_or_warning:n { width-without-X-columns } }
2014 }
```

Now, if there is at least one X-column in the environment, we compute the width that those columns will have (in the next compilation). In fact, `\l_@@_X_columns_dim` will be the width of a column of weight 1.0. For a X-column of weight x , the width will be `\l_@@_X_columns_dim` multiplied by x .

```

2015 \fp_compare:nNnT { \g_@@_total_X_weight_fp } > { \c_zero_fp }
2016 { \@@_compute_width_X: }
```

If the user has used the key `last-row` with a value, we control that the given value is correct (since we have just constructed the array, we know the actual number of rows of the array).

```

2017 \int_compare:nNnT { \l_@@_last_row_int } > { -2 }
2018 {
2019     \bool_if:NF \l_@@_last_row_without_value_bool
2020     {
2021         \int_compare:nNnF { \l_@@_last_row_int } = { \c@iRow }
2022         {
2023             \@@_error:n { Wrong-last-row }
2024             \int_gset_eq:NN \l_@@_last_row_int \c@iRow
2025         }
2026     }
2027 }
```

Now, the definition of `\c@jCol` and `\g_@@_col_total_int` changes: `\c@jCol` will be the number of columns without the “last column”; `\g_@@_col_total_int` will be the number of columns with this “last column”.⁹

```

2028 \int_gset_eq:NN \c@jCol \g_@@_col_total_int
2029 \bool_if:NTF \g_@@_last_col_found_bool
2030 { \int_gdecr:N \c@jCol }
2031 {
2032     \int_compare:nNnT { \l_@@_last_col_int } > { -1 }
2033     { \@@_error:n { last-col-not-used } }
2034 }
```

We fix also the value of `\c@iRow` and `\g_@@_row_total_int` with the same principle.

```

2035 \int_gset_eq:NN \g_@@_row_total_int \c@iRow
2036 \int_compare:nNnT { \l_@@_last_row_int } > { -1 }
2037 { \int_gdecr:N \c@iRow }
```

Now, we begin the real construction in the output flow of TeX. First, we take into account a potential “first column” (we remind that this “first column” has been constructed in an overlapping position and that we have computed its width in `\g_@@_width_first_col_dim`: see p. 92).

```

2038 \int_if_zero:nT { \l_@@_first_col_int }
2039 { \skip_horizontal:N \g_@@_width_first_col_dim }
```

The construction of the real box is different whether we have delimiters to put.

```

2040 \bool_if:NTF { ! \g_@@_delims_bool }
2041 {
2042     \str_if_eq:eeTF \l_@@_baseline_t1 { c }
2043     { \@@_use_arraybox_with_notes_c: }
2044     {
2045         \str_if_eq:eeTF \l_@@_baseline_t1 { b }
2046         { \@@_use_arraybox_with_notes_b: }
2047         { \@@_use_arraybox_with_notes: }
2048     }
2049 }
```

⁹We remind that the potential “first column” (exterior) has the number 0.

Now, in the case of an environment with delimiters. We compute $\l_l_tmpa_dim$ which is the total height of the “first row” above the array (when the key `first-row` is used).

```

2050   {
2051     \int_if_zero:nTF { \l_l@@_first_row_int }
2052     {
2053       \dim_set_eq:NN \l_ltmpa_dim \g_g@@_dp_row_zero_dim
2054       \dim_add:Nn \l_ltmpa_dim \g_g@@_ht_row_zero_dim
2055     }
2056     { \dim_zero:N \l_ltmpa_dim }

```

We compute $\l_l_tmpb_dim$ which is the total height of the “last row” below the array (when the key `last-row` is used). A value of -2 for $\l_l@@_last_row_int$ means that there is no “last row”.¹⁰

```

2057   \int_compare:nNnTF { \l_l@@_last_row_int } > { -2 }
2058   {
2059     \dim_set_eq:NN \l_ltmpb_dim \g_g@@_ht_last_row_dim
2060     \dim_add:Nn \l_ltmpb_dim \g_g@@_dp_last_row_dim
2061   }
2062   { \dim_zero:N \l_ltmpb_dim }

2063   \hbox_set:Nn \l_ltmpa_box
2064   {
2065     \m@th
2066     \c_math_toggle_token
2067     \l_l@@_color:o \l_l@@_delimiters_color_tl
2068     \exp_after:wN \left \g_g@@_left_delim_tl
2069     \vcenter
2070     {

```

We take into account the “first row” (we have previously computed its total height in $\l_l_tmpa_dim$). The `\hbox:n` (or `\hbox`) is necessary here.

```

2071     \skip_vertical:n { - \l_ltmpa_dim - \arrayrulewidth }
2072     \hbox
2073     {
2074       \bool_if:NTF \l_l@@_tabular_bool
2075         { \skip_horizontal:n { - \tabcolsep } }
2076         { \skip_horizontal:n { - \arraycolsep } }
2077       \l_l@@_use_arraybox_with_notes_c:
2078       \bool_if:NTF \l_l@@_tabular_bool
2079         { \skip_horizontal:n { - \tabcolsep } }
2080         { \skip_horizontal:n { - \arraycolsep } }
2081     }

```

We take into account the “last row” (we have previously computed its total height in $\l_l_tmpb_dim$).

```

2082     \skip_vertical:n { - \l_ltmpb_dim + \arrayrulewidth }
2083   }
2084   \exp_after:wN \right \g_g@@_right_delim_tl
2085   \c_math_toggle_token
2086 }
```

Now, the box $\l_l_tmpa_box$ is created with the correct delimiters.

We will put the box in the TeX flow. However, we have a small work to do when the option `delimiters/max-width` is used.

```

2087   \bool_if:NTF \l_l@@_delimiters_max_width_bool
2088   {
2089     \l_l@@_put_box_in_flow_bis:nn
2090     { \g_g@@_left_delim_tl }
2091     { \g_g@@_right_delim_tl }
2092   }
2093   \l_l@@_put_box_in_flow:
2094 }
```

We take into account a potential “last column” (this “last column” has been constructed in an overlapping position and we have computed its width in $\g_g@@_width_last_col_dim$: see p. 93).

¹⁰A value of -1 for $\l_l@@_last_row_int$ means that there is a “last row” but the user have not set the value with the option `last row` (and we are in the first compilation).

```

2095 \bool_if:NT \g_@@_last_col_found_bool
2096   { \skip_horizontal:N \g_@@_width_last_col_dim }
2097 \bool_if:NT \l_@@_preamble_bool
2098   {
2099     \int_compare:nNnT { \c@jCol } < { \g_@@_static_num_of_col_int }
2100     { \g_@@_err_columns_not_used: }
2101   }
2102 \g_@@_after_array:

```

The aim of the following `\egroup` (the corresponding `\bgroup` is, of course, at the beginning of the environment) is to be able to put an exposant to a matrix in a mathematical formula.

```
2103 \egroup
```

We write on the `aux` file all the information corresponding to the current environment.

```

2104 \iow_now:Nn \mainaux { \ExplSyntaxOn }
2105 \iow_now:Nn \mainaux { \char_set_catcode_space:n { 32 } }
2106 \iow_now:Ne \mainaux
2107   {

2111   }
2112 \iow_now:Nn \mainaux { \ExplSyntaxOff }

2113 \bool_if:NT \g_@@_footnote_bool { \endsavenotes }
2114 }
```

This is the end of the environment `{NiceArrayWithDelims}`.

```

2115 \cs_new_protected:Npn \g_@@_err_columns_not_used:
2116   {
2117     \g_@@_warning:n { columns-not-used }
2118     \cs_gset:Npn \g_@@_err_columns_not_used: { }
2119 }
```

The following command will be used only once. We have written that command for legibility. If there is at least one X-column in the environment, we compute the width that those columns will have (in the next compilation). In fact, `\l_@@_X_columns_dim` will be the width of a column of weight 1.0. For a X-column of weight x , the width will be `\l_@@_X_columns_dim` multiplied by x .

```

2120 \cs_new_protected:Npn \g_@@_compute_width_X:
2121   {
2122     \tl_gput_right:Ne \g_@@_aux_tl
2123     {
2124       \bool_set_true:N \l_@@_X_columns_aux_bool
2125       \dim_set:Nn \l_@@_X_columns_dim
2126     }

```

The flag `\g_@@_V_of_X_bool` is raised when there is at least in the tabular a column of type X using the key V. In that case, the width of the X column may be considered as correct even though the tabular has not (of course) a width equal to `\l_@@_width_dim`

```

2127 \bool_lazy_and:nnTF
2128   { \g_@@_V_of_X_bool }
2129   { \l_@@_X_columns_aux_bool }
2130   { \dim_use:N \l_@@_X_columns_dim }
2131   {
2132     \dim_compare:nNnTF
2133     {
2134       \dim_abs:n
2135       { \l_@@_width_dim - \box_wd:N \l_@@_the_array_box }
2136     }
2137     <
2138     { 0.001 pt }
2139     { \dim_use:N \l_@@_X_columns_dim }

```

```

2140 {
2141   \dim_eval:n
2142   {
2143     \l_@@_X_columns_dim
2144     +
2145     \fp_to_dim:n
2146     {
2147       (
2148         \dim_eval:n
2149         { \l_@@_width_dim - \box_wd:N \l_@@_the_array_box }
2150       )
2151       / \fp_use:N \g_@@_total_X_weight_fp
2152     }
2153   }
2154   }
2155 }
2156 }
2157 }
2158 }
2159 }
```

11 Construction of the preamble of the array

The final user provides a preamble, but we must convert that preamble into a preamble which will be given to `{array}` (of the package `array`).

The preamble given by the final user is stored in `\g_@@_user_preamble_tl`. The modified version will be stored in `\g_@@_array_preamble_tl`.

```

2160 \cs_new_protected:Npn \@@_transform_preamble:
2161 {
2162   \@@_transform_preamble_i:
2163   \@@_transform_preamble_ii:
2164 }
2165 \cs_new_protected:Npn \@@_transform_preamble_i:
2166 {
2167   \int_gzero:N \c@jCol
```

The sequence `\g_@@_cols_vlism_seq` will contain the numbers of the columns where you will have to draw vertical lines in the potential sub-matrices (hence the name `vlism`).

```
2168 \seq_gclear:N \g_@@_cols_vlism_seq
```

`\g_tmpb_bool` will be raised if you have a `|` at the end of the preamble provided by the final user.

```
2169 \bool_gset_false:N \g_tmpb_bool
```

The following sequence will store the arguments of the successive `>` in the preamble.

```
2170 \tl_gclear_new:N \g_@@_pre_cell_tl
```

The counter `\l_tmpa_int` will count the number of consecutive occurrences of the symbol `|`.

```

2171 \int_zero:N \l_tmpa_int
2172 \tl_gclear:N \g_@@_array_preamble_tl
2173 \str_if_eq:eeTF \l_@@_vlines_clist { all }
2174 {
2175   \tl_gset:Nn \g_@@_array_preamble_tl
2176   { ! { \skip_horizontal:N \arrayrulewidth } }
2177 }
2178 {
2179   \clist_if_in:NnT \l_@@_vlines_clist 1
2180   {
2181     \tl_gset:Nn \g_@@_array_preamble_tl
```

```

2182         { ! { \skip_horizontal:N \arrayrulewidth } }
2183     }
2184 }
```

Now, we actually make the preamble (which will be given to `{array}`). It will be stored in `\g_@@_array_preamble_tl`.

```

2185     \exp_last_unbraced:No \g_@@_rec_preamble:n \g_@@_user_preamble_tl \s_stop
2186     \int_gset_eq:NN \g_@@_static_num_of_col_int `c@jCol
2187     \g_@@_replace_columncolor:
2188 }
```

```

2189 \cs_new_protected:Npn \g_@@_transform_preamble_ii:
2190 {
```

If there were delimiters at the beginning or at the end of the preamble, the environment `{NiceArray}` is transformed into an environment `{xNiceMatrix}`.

```

2191 \tl_if_eq:NNTF \g_@@_left_delim_tl \c_@@_dot_tl
2192 {
2193     \tl_if_eq:NNF \g_@@_right_delim_tl \c_@@_dot_tl
2194     { \bool_gset_true:N \g_@@_delims_bool }
2195 }
2196 { \bool_gset_true:N \g_@@_delims_bool }
```

We want to remind whether there is a specifier `|` at the end of the preamble.

```

2225         }
2226     }
2227 }
```

We add a last column to raise a good error message when the user puts more columns than allowed by its preamble. However, for technical reasons, it's not possible to do that in `{NiceTabular*}` (we control that with the value of `\l_@@_tabular_width_dim`).

```
2228 \dim_compare:nNnT { \l_@@_tabular_width_dim } = { \c_zero_dim }
2229 {
```

If the tagging of the tabulars is done (part of the Tagging Project), you don't activate that mechanism because it would create a dummy column of tagged empty cells.

```
2230 \bool_if:NF \c_@@_testphase_table_bool
2231 {
2232     \tl_gput_right:Nn \g_@@_array_preamble_tl
2233     { > { \c_error_too_much_cols: } 1 }
2234 }
2235 }
2236 }
```

The preamble provided by the final user will be read by a finite automata. The following function `\c_rec_preamble:n` will read that preamble (usually letter by letter) in a recursive way (hence the name of that function). in the preamble.

```
2237 \cs_new_protected:Npn \c_rec_preamble:n #1
2238 {
```

For the majority of the letters, we will trigger the corresponding action by calling directly a function in the main hashtable of TeX (thanks to the mechanism `\csname... \endcsname`. Be careful: all these functions take in as first argument the letter (or token) itself.¹¹

```
2239 \cs_if_exist:cTF { @@ _ \token_to_str:N #1 : }
2240     { \use:c { @@ _ \token_to_str:N #1 : } { #1 } }

```

The following command will be used in m-columns in order to center vertically the box. In fact, despite its name, the command does not always center the cell. Indeed, if there is only one row in the cell, it should not be centered vertically. It's not possible to know the number of rows of the cell. However, we consider (as in array) that if the height of the cell is no more than the height of `\strutbox`, there is only one row.

```

2501 \cs_new_protected:Npn \@@_center_cell_box:
2502 {

```

By putting instructions in `\g_@@_cell_after_hook_tl`, we require a post-action of the box `\l_@@_cell_box`.

2783   \exp_last_unbraced:No \@@_rec_preamble:n \l_tmpa_tl
2784 }
```

The token `\NC@find` is at the head of the definition of the `columns` type done by `\newcolumntype`. We want that token to be no-op here.

```

2785 \cs_new_protected:cpn { @_ _ \token_to_str:N \NC@find : } #1
2786   { \@@_rec_preamble:n }
```

For the case of a letter `X`. This specifier may take in an optional argument (between square brackets). That's why we test whether there is a `[` after the letter `X`.

```

2787 \cs_new_protected:Npn \@@_X: #1 #2
2788 {
2789   \str_if_eq:nnTF { #2 } { [ ]
2790     { \@@_make_preamble_X:w [ ]
2791     { \@@_make_preamble_X:w [ ] #2 }
2792   }
2793 \cs_new_protected:Npn \@@_make_preamble_X:w [ #1 ]
2794   { \@@_make_preamble_X_i:n { #1 } }
```

`#1` is the optional argument of the `X` specifier (a list of *key-value* pairs).

The following set of keys is for the specifier `X` in the preamble of the array. Such specifier may have as keys all the keys of `{ nicematrix / p-column }` but also a key `V` and also a key which corresponds to a positive number (1, 2, 0.5, etc.) which is the *weight* of the columns. The following set of keys will be used to retrieve that value and store it in `\l_tmpa_fp`.

```

2795 \keys_define:nn { nicematrix / X-column }
2796 {
2797   V .code:n =
2798     \IfPackageLoadedTF { varwidth }
2799     {
2800       \bool_set_true:N \l_@@_V_of_X_bool
2801       \bool_gset_true:N \g_@@_V_of_X_bool
2802     }
2803     { \@@_error_or_warning:n { varwidth-not-loaded-in-X } },
2804   unknown .code:n =
2805     \regex_match:nVT{ \A[0-9]*\.[0-9]*\Z } \l_keys_key_str
2806     { \fp_set:Nn \l_tmpa_fp { \l_keys_key_str } }
2807     { \@@_error_or_warning:n { invalid-weight } }
2808 }
```

In the following command, `#1` is the list of the options of the specifier `X`.

```

2809 \cs_new_protected:Npn \@@_make_preamble_X_i:n #1
2810   { }
```

The possible values of `\l_@@_hpos_col_str` are `j` (for *justified* which is the initial value), `l`, `c` and `r` (when the user has used the corresponding key in the optional argument of the specifier `X`).

```

2811 \str_set:Nn \l_@@_hpos_col_str { j }
```

The possible values of `\l_@@_vpos_col_str` are `p` (the initial value), `m` and `b` (when the user has used the corresponding key in the optional argument of the specifier `X`).

```

2812 \str_set:Nn \l_@@_vpos_col_str { p }
```

We will store in `\l_tmpa_fp` the weight of the column (`\l_tmpa_fp` also appears in `{nicematrix/X-column}` and the error message `invalid~weight`).

```

2813 \fp_set:Nn \l_tmpa_fp { 1.0 }
2814 \@@_keys_p_column:n { #1 }
```

The unknown keys have been stored by `\@@_keys_p_column:n` in `\l_tmpa_t1` and we use them right now in the set of keys `nicematrix/X-column` in order to retrieve the potential weight explicitly provided by the final user.

```
2815     \bool_set_false:N \l_@@_V_of_X_bool
2816     \keys_set:no { nicematrix / X-column } \l_tmpa_t1
```

Now, the weight of the column is stored in `\l_tmpa_t1`.

```
2817     \fp_gadd:Nn \g_@@_total_X_weight_fp \l_tmpa_fp
```

We test whether we know the actual width of the X-columns by reading the `aux` file (after the first compilation, the width of the X-columns is computed and written in the `aux` file).

```
2818     \bool_if:NTF \l_@@_X_columns_aux_bool
2819     {
2820         \@@_make_preamble_ii_iv:nnn
```

Of course, the weight of a column depends of its weight (in `\l_tmpa_fp`).

```
2821     { \fp_use:N \l_tmpa_fp \l_@@_X_columns_dim }
2822     { \bool_if:NTF \l_@@_V_of_X_bool { varwidth } { minipage } }
2823     { \@@_no_update_width: }
2824 }
```

In the current compilation, we don't known the actual width of the X column. However, you have to construct the cells of that column! By convention, we have decided to compose in a `{minipage}` of width 5 cm even though we will nullify `\l_@@_cell_box` after its composition.

```
2825     {
2826         \tl_gput_right:Nn \g_@@_array_preamble_tl
2827         {
2828             > {
2829                 \@@_cell_begin:
2830                 \bool_set_true:N \l_@@_X_bool
```

You encounter a problem on 2023-03-04: for an environment with X columns, during the first compilations (which are not the definitive one), sometimes, some cells are declared empty even if they should not. That's a problem because user's instructions may use these nodes. That's why we have added the following `\NotEmpty`.

```
2831     \NotEmpty
```

The following code will nullify the box of the cell.

```
2832     \tl_gput_right:Nn \g_@@_cell_after_hook_tl
2833     { \hbox_set:Nn \l_@@_cell_box { } }
```

We put a `{minipage}` to give to the user the ability to put a command such as `\centering` in the `\RowStyle`.

```
2834         \begin{minipage}{5cm} \arraybackslash
2835     }
2836     c
2837     < {
2838         \end{minipage}
2839         \@@_cell_end:
2840     }
2841     }
2842     \int_gincr:N \c@jCol
2843     \@@_rec_preamble_after_col:n
2844 }
2845 }

2846 \cs_new_protected:Npn \@@_no_update_width:
2847 {
2848     \tl_gput_right:Nn \g_@@_cell_after_hook_tl
2849     { \cs_set_eq:NN \@@_update_max_cell_width: \prg_do_nothing: }
2850 }
```

For the letter set by the user with `vlines-in-sub-matrix` (`vlism`).

3305 \dim_set:Nn \l_@@_real_right_delim_dim
3306 { \box_wd:N \l_tmpb_box - \nulldelimiterspace }
```

Now, we can put the box in the TeX flow with the horizontal adjustments on both sides.

```
3307 \skip_horizontal:n { \l_@@_left_delim_dim - \l_@@_real_left_delim_dim }
3308 \@@_put_box_in_flow:
3309 \skip_horizontal:n { \l_@@_right_delim_dim - \l_@@_real_right_delim_dim }
3310 }
```

The construction of the array in the environment `{NiceArrayWithDelims}` is, in fact, done by the environment `{@@-light-syntax}` or by the environment `{@@-normal-syntax}` (whether the option `light-syntax` is in force or not). When the key `light-syntax` is not used, the construction is a standard environment (and, thus, it's possible to use verbatim in the array).

```
3311 \NewDocumentEnvironment { @@-normal-syntax } { }
```

First, we test whether the environment is empty. If it is empty, we raise a fatal error (it's only a security). In order to detect whether it is empty, we test whether the next token is `\end` and, if it's the case, we test if this is the end of the environment (if it is not, a standard error will be raised by LaTeX for incorrect nested environments).

```
3312 {
3313     \peek_remove_spaces:n
3314     {
3315         \peek_meaning:NTF \end
3316         { \@@_analyze_end:Nn }
```

```

3317      {
3318          \@@_transform_preamble:
3319          \@@_array:o \g_@@_array_preamble_tl
3320      }
3321  }
3322  {
3323      \@@_create_col_nodes:
3324      \endarray
3325  }
3326 }
```

When the key `light-syntax` is in force, we use an environment which takes its whole body as an argument (with the specifier `b`).

```

3327 \NewDocumentEnvironment { @@-light-syntax } { b }
3328 {
```

First, we test whether the environment is empty. It's only a security. Of course, this test is more easy than the similar test for the "normal syntax" because we have the whole body of the environment in `#1`.

```

3329     \tl_if_empty:nT { #1 }
3330     { \@@_fatal:n { empty~environment } }
3331     \tl_if_in:nnT { #1 } { & }
3332     { \@@_fatal:n { ampersand-in-light-syntax } }
3333     \tl_if_in:nnT { #1 } { \\ }
3334     { \@@_fatal:n { double-backslash-in-light-syntax } }
```

Now, you extract the `\CodeAfter` of the body of the environment. Maybe, there is no command `\CodeAfter` in the body. That's why you put a marker `\CodeAfter` after `#1`. If there is yet a `\CodeAfter` in `#1`, this second (or third...) `\CodeAfter` will be caught in the value of `\g_nicematrix_code_after_tl`. That doesn't matter because `\CodeAfter` will be set to `no-op` before the execution of `\g_nicematrix_code_after_tl`.

```
3335     \@@_light_syntax_i:w #1 \CodeAfter \q_stop
```

The command `\array` is hidden somewhere in `\@@_light_syntax_i:w`.

```
3336 }
```

Now, the second part of the environment. We must leave these lines in the second part (and not put them in the first part even though we caught the whole body of the environment with an argument of type `b`) in order to have the columns `S` of `siunitx` working fine.

```

3337 {
3338     \@@_create_col_nodes:
3339     \endarray
3340 }
3341 \cs_new_protected:Npn \@@_light_syntax_i:w #1\CodeAfter #2 \q_stop
3342 {
3343     \tl_gput_right:Nn \g_nicematrix_code_after_tl { #2 }
```

The body of the array, which is stored in the argument `#1`, is now split into items (and *not* tokens).

```
3344     \seq_clear_new:N \l_@@_rows_seq
```

We rescan the character of end of line in order to have the correct catcode.

```

3345     \tl_set_rescan:Nno \l_@@_end_of_row_tl { } \l_@@_end_of_row_tl
3346     \bool_if:NTF \l_@@_light_syntax_expanded_bool
3347     { \seq_set_split:Nee }
3348     { \seq_set_split:Non }
3349     \l_@@_rows_seq \l_@@_end_of_row_tl { #1 }
```

We delete the last row if it is empty.

```

3350     \seq_pop_right:NN \l_@@_rows_seq \l_tmpa_tl
3351     \tl_if_empty:NF \l_tmpa_tl
3352     { \seq_put_right:No \l_@@_rows_seq \l_tmpa_tl }
```

If the environment uses the option `last-row` without value (i.e. without saying the number of the rows), we have now the opportunity to compute that value. We do it, and so, if the token list `\l_@@_code_for_last_row_t1` is not empty, we will use directly where it should be.

```
3353     \int_compare:nNnT { \l_@@_last_row_int } = { -1 }
3354         { \int_set:Nn \l_@@_last_row_int { \seq_count:N \l_@@_rows_seq } }
```

The new value of the body (that is to say after replacement of the separators of rows and columns by `\backslash` and `&`) of the environment will be stored in `\l_@@_new_body_t1` in order to allow the use of commands such as `\hline` or `\hdottedline` with the key `light-syntax`.

```
3355     \tl_build_begin:N \l_@@_new_body_t1
3356     \int_zero_new:N \l_@@_nb_cols_int
```

First, we treat the first row.

```
3357     \seq_pop_left:NN \l_@@_rows_seq \l_tmpa_t1
3358         \@@_line_with_light_syntax:o \l_tmpa_t1
```

Now, the other rows (with the same treatment, excepted that we have to insert `\backslash` between the rows).

```
3359     \seq_map_inline:Nn \l_@@_rows_seq
3360     {
3361         \tl_build_put_right:Nn \l_@@_new_body_t1 { \backslash }
3362         \@@_line_with_light_syntax:n { ##1 }
3363     }
3364     \tl_build_end:N \l_@@_new_body_t1
3365     \int_compare:nNnT { \l_@@_last_col_int } = { -1 }
3366     {
3367         \int_set:Nn \l_@@_last_col_int
3368             { \l_@@_nb_cols_int - 1 + \l_@@_first_col_int }
3369     }
```

Now, we can construct the preamble: if the user has used the key `last-col`, we have the correct number of columns even though the user has used `last-col` without value.

```
3370     \@@_transform_preamble:
```

The call to `\array` is in the following command (we have a dedicated macro `\@@_array`: because of compatibility with the classes `revtex4-1` and `revtex4-2`).

```

3828     }
3829 }
3830 \cs_new_protected:Npn \@@_after_array:
3831 {
```

There was a `\hook_gput_code:nnn { env / tabular / begin } { nicematrix }` in the command `\@@_pre_array_ii`: in order to come back to the standard definition of `\multicolumn` (in the tabulars used by the final user in the cells of our array of `nicematrix`) and maybe another linked to `colortbl`.

```

3832     \hook_gremove_code:nn { env / tabular / begin } { nicematrix }
3833     \group_begin:
```

When the option `last-col` is used in the environments with explicit preambles (like `{NiceArray}`, `{pNiceArray}`, etc.) a special type of column is used at the end of the preamble in order to compose the cells in an overlapping position (with `\hbox_overlap_right:n`) but (if `last-col` has been used), we don't have the number of that last column. However, we have to know that number for the color of the potential `\Vdots` drawn in that last column. That's why we fix the correct value of `\l_@@_last_col_int` in that case.

```

3834     \bool_if:NT \g_@@_last_col_found_bool
3835         { \int_set_eq:NN \l_@@_last_col_int \g_@@_col_total_int }
```

If we are in an environment without preamble (like `{NiceMatrix}` or `{pNiceMatrix}`) and if the option `last-col` has been used without value we also fix the real value of `\l_@@_last_col_int`.

```

3836     \bool_if:NT \l_@@_last_col_without_value_bool
3837         { \int_set_eq:NN \l_@@_last_col_int \g_@@_col_total_int }
```

It's also time to give to `\l_@@_last_row_int` its real value.

```

3838   \bool_if:NT \l_@@_last_row_without_value_bool
3839     { \int_set_eq:NN \l_@@_last_row_int \g_@@_row_total_int }

3840   \tl_gput_right:N \g_@@_aux_tl
3841   {
3842     \seq_gset_from_clist:Nn \exp_not:N \g_@@_size_seq
3843     {
3844       \int_use:N \l_@@_first_row_int ,
3845       \int_use:N \c@iRow ,
3846       \int_use:N \g_@@_row_total_int ,
3847       \int_use:N \l_@@_first_col_int ,
3848       \int_use:N \c@jCol ,
3849       \int_use:N \g_@@_col_total_int
3850     }
3851   }

```

We write also the potential content of `\g_@@_pos_of_blocks_seq`. It will be used to recreate the blocks with a name in the `\CodeBefore` and also if the command `\rowcolors` is used with the key `respect-blocks`.

```

3852   \seq_if_empty:NF \g_@@_pos_of_blocks_seq
3853   {
3854     \tl_gput_right:N \g_@@_aux_tl
3855     {
3856       \seq_gset_from_clist:Nn \exp_not:N \g_@@_pos_of_blocks_seq
3857       { \seq_use:Nnnn \g_@@_pos_of_blocks_seq , , , }
3858     }
3859   }
3860   \seq_if_empty:NF \g_@@_multicolumn_cells_seq
3861   {
3862     \tl_gput_right:N \g_@@_aux_tl
3863     {
3864       \seq_gset_from_clist:Nn \exp_not:N \g_@@_multicolumn_cells_seq
3865       { \seq_use:Nnnn \g_@@_multicolumn_cells_seq , , , }
3866       \seq_gset_from_clist:Nn \exp_not:N \g_@@_multicolumn_sizes_seq
3867       { \seq_use:Nnnn \g_@@_multicolumn_sizes_seq , , , }
3868     }
3869   }

```

Now, you create the diagonal nodes by using the `row` nodes and the `col` nodes.

```
3870   \@@_create_diag_nodes:
```

We create the aliases using `last` for the nodes of the cells in the last row and the last column.

```

3871   \pgfpicture
3872   \@@_create_aliases_last:
3873   \str_if_empty:NF \l_@@_name_str { \@@_create_alias_nodes: }
3874   \endpgfpicture

```

By default, the diagonal lines will be parallelized¹². There are two types of diagonals lines: the `\Ddots` diagonals and the `\Idots` diagonals. We have to count both types in order to know whether a diagonal is the first of its type in the current `{NiceArray}` environment.

```

3875   \bool_if:NT \l_@@_parallelize_diags_bool
3876   {
3877     \int_gzero:N \g_@@_ddots_int
3878     \int_gzero:N \g_@@_iddots_int

```

The dimensions `\g_@@_delta_x_one_dim` and `\g_@@_delta_y_one_dim` will contain the Δ_x and Δ_y of the first `\Ddots` diagonal. We have to store these values in order to draw the others `\Ddots` diagonals parallel to the first one. Similarly `\g_@@_delta_x_two_dim` and `\g_@@_delta_y_two_dim` are the Δ_x and Δ_y of the first `\Idots` diagonal.

¹²It's possible to use the option `parallelize-diags` to disable this parallelization.

```

3879     \dim_gzero:N \g_@@_delta_x_one_dim
3880     \dim_gzero:N \g_@@_delta_y_one_dim
3881     \dim_gzero:N \g_@@_delta_x_two_dim
3882     \dim_gzero:N \g_@@_delta_y_two_dim
3883 }
3884 \bool_set_false:N \l_@@_initial_open_bool
3885 \bool_set_false:N \l_@@_final_open_bool

```

If the option `small` is used, the values `\l_@@_xdots_radius_dim` and `\l_@@_xdots_inter_dim` (used to draw the dotted lines created by `\hdottedline` and `\vdottedline` and also for all the other dotted lines when `line-style` is equal to `standard`, which is the initial value) are changed.

```
3886 \bool_if:NT \l_@@_small_bool { \@@_tuning_key_small_for_dots: }
```

Now, we actually draw the dotted lines (specified by `\Cdots`, `\Vdots`, etc.).

```
3887 \@@_draw_dotted_lines:
```

The following computes the “corners” (made up of empty cells) but if there is no corner to compute, it won’t do anything. The corners are computed in `\l_@@_corners_cells_clist` which will contain all the cells which are empty (and not in a block) considered in the corners of the array.

```

3888 \clist_if_empty:NF \l_@@_corners_clist
3889 {
3890     \bool_if:NTF \l_@@_no_cell_nodes_bool
3891     { \@@_error:n { corners-with-no-cell-nodes } }
3892     { \@@_compute_corners: }
3893 }

```

The sequence `\g_@@_pos_of_blocks_seq` must be “adjusted” (for the case where the user have written something like `\Block{1-*}`).

```

3894 \@@_adjust_pos_of_blocks_seq:
3895 \@@_deal_with_rounded_corners:
3896 \clist_if_empty:NF \l_@@_hlines_clist { \@@_draw_hlines: }
3897 \clist_if_empty:NF \l_@@_vlines_clist { \@@_draw_vlines: }

```

Now, the pre-code-after and then, the `\CodeAfter`.

```

3898 \IfPackageLoadedT { tikz }
3899 {
3900     \tikzset
3901     {
3902         every~picture / .style =

```

The LaTeX-style boolean `\ifmeasuring@` is used by `amsmath` during the phase of measure in environments such as `{align}`, etc.

```

3918 \legacy_if:nF { measuring@ } { \g_@@_pre_code_after_tl }
3919 \tl_gclear:N \g_@@_pre_code_after_tl

```

When `light-syntax` is used, we insert systematically a `\CodeAfter` in the flow. Thus, it's possible to have two instructions `\CodeAfter` and the second may be in `\g_nicematrix_code_after_tl`. That's why we set `\CodeAfter` to be *no-op* now.

```
3920     \cs_set_eq:NN \CodeAfter \prg_do_nothing:
```

We clear the list of the names of the potential `\SubMatrix` that will appear in the `\CodeAfter` (unfortunately, that list has to be global).

```
3921     \seq_gclear:N \g_@@_submatrix_names_seq
```

The following code is a security for the case the user has used `babel` with the option `spanish`: in that case, the characters `>` and `<` are activated and Tikz is not able to solve the problem (even with the Tikz library `babel`).

```
3922     \int_compare:nNnT { \char_value_catcode:n { 60 } } = { 13 }
3923         { \@@_rescan_for_spanish:N \g_nicematrix_code_after_tl }
```

And here's the `\CodeAfter`. Since the `\CodeAfter` may begin with an “argument” between square brackets of the options, we extract and treat that potential “argument” with the command `\@@_CodeAfter_keys`:

```
3924     \bool_set_true:N \l_@@_in_code_after_bool
3925     \exp_last_unbraced:No \@@_CodeAfter_keys: \g_nicematrix_code_after_tl
3926     \scan_stop:
3927     \tl_gclear:N \g_nicematrix_code_after_tl
3928     \group_end:
```

`\g_@@_pre_code_before_tl` is for instructions in the cells of the array such as `\rowcolor` and `\cellcolor`. These instructions will be written on the `aux` file to be added to the `code-before` in the next run.

```
3929     \seq_if_empty:NF \g_@@_rowlistcolors_seq { \@@_clear_rowlistcolors_seq: }
3930     \tl_if_empty:NF \g_@@_pre_code_before_tl
3931     {
3932         \tl_gput_right:Ne \g_@@_aux_tl

3980 }

```

We remind that the first mandatory argument of the command `\Block` is the size of the block with the special format $i-j$. However, the user is allowed to omit i or j (or both). This will be interpreted as: the last row (resp. column) of the block will be the last row (resp. column) of the block (without the potential exterior row—resp. column—of the array). By convention, this is stored in `\g_@@_pos_of_blocks_seq` (and `\g_@@_blocks_seq`) as a number of rows (resp. columns) for the block equal to 100. It’s possible, after the construction of the array, to replace these values by the correct ones (since we know the number of rows and columns of the array).

```

4084             { \@@_env: - last }
4085     }
4086 \endpgfpicture
4087 }

```

16 We draw the dotted lines

A dotted line will be said *open* in one of its extremities when it stops on the edge of the matrix and *closed* otherwise. In the following matrix, the dotted line is closed on its left extremity and open on its right.

$$\begin{pmatrix} a+b+c & a+b & a \\ & \dots & \dots \\ a & a+b & a+b+c \end{pmatrix}$$

The command `\@_find_extremities_of_line:nnnn` takes four arguments:

- the first argument is the row of the cell where the command was issued;
- the second argument is the column of the cell where the command was issued;
- the third argument is the x -value of the orientation vector of the line;
- the fourth argument is the y -value of the orientation vector of the line.

This command computes:

- `\l @_initial_i_int` and `\l @_initial_j_int` which are the coordinates of one extremity of the line;
- `\l @_final_i_int` and `\l @_final_j_int` which are the coordinates of the other extremity of the line;
- `\l @_initial_open_bool` and `\l @_final_open_bool` to indicate whether the extremities are open or not.

```
4088 \cs_new_protected:Npn \@_find_extremities_of_line:nnnn #1 #2 #3 #4
4089 {
```

First, we declare the current cell as “dotted” because we forbide intersections of dotted lines.

```
4090 \cs_set_nopar:cpn { @_ dotted _ #1 - #2 } { }
```

Initialization of variables.

```
4091 \int_set:Nn \l @_initial_i_int { #1 }
4092 \int_set:Nn \l @_initial_j_int { #2 }
4093 \int_set:Nn \l @_final_i_int { #1 }
4094 \int_set:Nn \l @_final_j_int { #2 }
```

We will do two loops: one when determining the initial cell and the other when determining the final cell. The boolean `\l @_stop_loop_bool` will be used to control these loops. In the first loop, we search the “final” extremity of the line.

```
4095 \bool_set_false:N \l @_stop_loop_bool
4096 \bool_do_until:Nn \l @_stop_loop_bool
4097 {
4098     \int_add:Nn \l @_final_i_int { #3 }
4099     \int_add:Nn \l @_final_j_int { #4 }
4100     \bool_set_false:N \l @_final_open_bool
```

We test if we are still in the matrix. Since this is the core of the loop, we **optimize** the code by using a TeX-style of conditionals.

4229 {
430     { \int_use:N \l_@@_initial_i_int }
```

Be careful: with `\Iddots`, `\l_@@_final_j_int` is inferior to `\l_@@_initial_j_int`. That's why we use `\int_min:nn` and `\int_max:nn`.

```
4231     { \int_min:nn { \l_@@_initial_j_int } { \l_@@_final_j_int } }
4232     { \int_use:N \l_@@_final_i_int }
4233     { \int_max:nn { \l_@@_initial_j_int } { \l_@@_final_j_int } }
4234     { } % for the name of the block
4235 }
4236 }
```

If the final user uses the key `xdots/shorten` in `\NiceMatrixOptions` or at the level of an environment (such as `{pNiceMatrix}`, etc.), only the so called “closed extremities” will be shortened by that key. The following command will be used *after* the detection of the extremities of a dotted line (hence at a time when we known whether the extremities are closed or open) but before the analyse of the keys of the individual command `\Cdots`, `\Vdots`. Hence, the keys `shorten`, `shorten-start` and `shorten-end` of that individual command will be applied.

```
4237 \cs_new_protected:Npn \@@_open_shorten:
4238 {
4239     \bool_if:NT \l_@@_initial_open_bool
4240         { \dim_zero:N \l_@@_xdots_shorten_start_dim }
4241     \bool_if:NT \l_@@_final_open_bool
4242         { \dim_zero:N \l_@@_xdots_shorten_end_dim }
4243 }
```

The following command (*when it will be written*) will set the four counters `\l_@@_row_min_int`, `\l_@@_row_max_int`, `\l_@@_col_min_int` and `\l_@@_col_max_int` to the intersections of the submatrices which contains the cell of row #1 and column #2. As of now, it's only the whole array (excepted exterior rows and columns).

```
4244 \cs_new_protected:Npn \@@_adjust_to_submatrix:nn #1 #2
4245 {
4246     \int_set_eq:NN \l_@@_row_min_int \c_one_int
4247     \int_set_eq:NN \l_@@_col_min_int \c_one_int
4248     \int_set_eq:NN \l_@@_row_max_int \c@iRow
4249     \int_set_eq:NN \l_@@_col_max_int \c@jCol
```

We do a loop over all the submatrices specified in the `code-before`. We have stored the position of all those submatrices in `\g_@@_submatrix_seq`.

```
4250 \seq_if_empty:NF \g_@@_submatrix_seq
4251 {
4252     \seq_map_inline:Nn \g_@@_submatrix_seq
4253         { \@@_adjust_to_submatrix:nnnnnn { #1 } { #2 } ##1 }
4254     }
4255 }
```

#1 and #2 are the numbers of row and columns of the cell where the command of dotted line (ex.: `\Vdots`) has been issued. #3, #4, #5 and #6 are the specification (in *i* and *j*) of the submatrix we are analyzing.

Here is the programmation of that command with the the standard syntax of L3.

```
\cs_new_protected:Npn \@@_adjust_to_submatrix:nnnnnn #1 #2 #3 #4 #5 #6
{
    \bool_if:nT
    {
        \int_compare_p:n { #3 <= #1 <= #5 }
        &&
        \int_compare_p:n { #4 <= #2 <= #6 }
```

```

}
{
    \int_set:Nn \l_@@_row_min_int { \int_max:nn \l_@@_row_min_int { #3 } }
    \int_set:Nn \l_@@_col_min_int { \int_max:nn \l_@@_col_min_int { #4 } }
    \int_set:Nn \l_@@_row_max_int { \int_min:nn \l_@@_row_max_int { #5 } }
    \int_set:Nn \l_@@_col_max_int { \int_min:nn \l_@@_col_max_int { #6 } }
}
}

```

However, for efficiency, we will use the following version.

```

4520

```

The following function is used by regular calls of `\Vdots` or `\Vdotsfor` but not by `\Vbrace`. The command `\@@_actually_draw_Vdots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool`.

```

4521 \cs_new_protected:Npn \@@_actually_draw_Vdots:
4522 {
4523     \bool_lazy_and:nnTF { \l_@@_initial_open_bool } { \l_@@_final_open_bool }
4524         { \@@_actually_draw_Vdots_i: }
4525         { \@@_actually_draw_Vdots_ii: }
4526     \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim
4527     \@@_draw_line:
4528 }

```

First, the case of a dotted line open on both sides.

```

4529 \cs_new_protected:Npn \@@_actually_draw_Vdots_i:
4530 {
4531     \@@_open_y_initial_dim:
4532     \@@_open_y_final_dim:
4533     \int_if_zero:nTF { \l_@@_initial_j_int }

```

We have a dotted line open on both sides in the “first column”.

```

4534 {
4535     \@@_qpoint:n { col - 1 }
4536     \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
4537     \dim_sub:Nn \l_@@_x_initial_dim
4538         { \@@_colsep: + \l_@@_left_margin_dim + \l_@@_extra_left_margin_dim }
4539 }
4540 {

```

```

4541 \bool_lazy_and:nNF
4542   { \int_compare_p:nNn { \l_@@_last_col_int } > { -2 } }
4543   {
4544     \int_compare_p:nNn
4545       { \l_@@_initial_j_int } = { \g_@@_col_total_int }
4546   }

```

We have a dotted line open on both sides and which is in the “last column”.

```

4547   {
4548     \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
4549     \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
4550     \dim_add:Nn \l_@@_x_initial_dim
4551       { \@@_colsep: + \l_@@_right_margin_dim + \l_@@_extra_right_margin_dim }
4552   }

```

We have a dotted line open on both sides which is *not* in an exterior column.

```

4553   {
4554     \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
4555     \dim_set_eq:NN \l_tmpa_dim \pgf@x
4556     \@@_qpoint:n { col - \int_eval:n { \l_@@_initial_j_int + 1 } }
4557     \dim_set:Nn \l_@@_x_initial_dim { ( \pgf@x + \l_tmpa_dim ) / 2 }
4558   }
4559 }
4560 }

```

The command `\@@_draw_line:` is in `\@@_actually_draw_Vdots:`

Now, the dotted line is *not* open on both sides (maybe open on only one side).

The main task is to determine the x -value of the dotted line to draw.

The boolean `\l_tmpa_bool` will indicate whether the column is of type 1 or may be considered as if.

```

4561 \cs_new_protected:Npn \@@_actually_draw_Vdots_ii:
4562   {
4563     \bool_set_false:N \l_tmpa_bool
4564     \bool_if:NTF \l_@@_initial_open_bool
4565     {
4566       \bool_if:NTF \l_@@_final_open_bool
4567       {
4568         \@@_set_initial_coords_from_anchor:n { south-west }
4569         \@@_set_final_coords_from_anchor:n { north-west }
4570         \bool_set:Nn \l_tmpa_bool
4571           {
4572             \dim_compare_p:nNn
4573               { \l_@@_x_initial_dim } = { \l_@@_x_final_dim }
4574           }
4575       }
4576     }
4577   }

```

Now, we try to determine whether the column is of type c or may be considered as if.

```

4577 \bool_if:NTF \l_@@_initial_open_bool
4578   {
4579     \@@_open_y_initial_dim:
4580     \@@_set_final_coords_from_anchor:n { north }
4581     \dim_set_eq:NN \l_@@_x_initial_dim \l_@@_x_final_dim
4582   }
4583   {
4584     \@@_set_initial_coords_from_anchor:n { south }
4585     \bool_if:NTF \l_@@_final_open_bool
4586       { \@@_open_y_final_dim: }

```

Now the case where both extremities are closed. The first conditional tests whether the column is of type c or may be considered as if.

```

4587   {
4588     \@@_set_final_coords_from_anchor:n { north }
4589     \dim_compare:nNnf { \l_@@_x_initial_dim } = { \l_@@_x_final_dim }
4590       {

```

```

4591     \dim_set:Nn \l_@@_x_initial_dim
4592     {
4593         \bool_if:NTF \l_tmpa_bool { \dim_min:nn } { \dim_max:nn }
4594             \l_@@_x_initial_dim \l_@@_x_final_dim
4595     }
4596 }
4597 }
4598 }
4599 }
```

The following function is used by `\Vbrace` but not by regular uses of `\Vdots` or `\Vdotsfor`. The command `\@@_actually_draw_Vbrace:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool.`

```

4600 \cs_new_protected:Npn \@@_actually_draw_Vbrace:
4601 {
4602     \bool_if:NTF \l_@@_initial_open_bool
4603         { \@@_open_y_initial_dim: }
4604         { \@@_set_initial_coords_from_anchor:n { south } }
4605     \bool_if:NTF \l_@@_final_open_bool
4606         { \@@_open_y_final_dim: }
4607         { \@@_set_final_coords_from_anchor:n { north } }
```

Now, we have the correct values for the y -values of both extremities of the brace. We have to compute the x -value (there is only one x -value since, of course, the brace is vertical).

If we are in the first (exterior) column, the brace must be drawn right flush.

```

4608 \int_if_zero:nTF { \l_@@_initial_j_int }
4609 {
4610     \@@_qpoint:n { col - 1 }
4611     \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
4612     \dim_sub:Nn \l_@@_x_initial_dim
4613         { \@@_colsep: + \l_@@_left_margin_dim + \l_@@_extra_left_margin_dim }
4614 }
```

Elsewhere, the brace must be drawn left flush.

```

4615 {
4616     \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
4617     \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
4618     \dim_add:Nn \l_@@_x_initial_dim
4619         { \@@_colsep: + \l_@@_right_margin_dim + \l_@@_extra_right_margin_dim }
4620 }
```

We draw a vertical rule and that's why, of course, both x -values are equal.

```

4621 \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim
4622 \@@_draw_line:
4623 }
4624 \cs_new:Npn \@@_colsep:
4625     { \bool_if:NTF \l_@@_tabular_bool { \tabcolsep } { \arraycolsep } }
```

For the diagonal lines, the situation is a bit more complicated because, by default, we parallelize the diagonals lines. The first diagonal line is drawn and then, all the other diagonal lines are drawn parallel to the first one.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```
4626 \cs_new_protected:Npn \@@_draw_Ddots:nnn #1 #2 #3
4627 {
4628   \@@_adjust_to_submatrix:nn { #1 } { #2 }
4629   \cs_if_free:cT { @_ dotted _ #1 - #2 }
4630   {
4631     \@@_find_extremities_of_line:nnnn { #1 } { #2 } { 1 } { 1 }
```

The previous command may have changed the current environment by marking some cells as “dotted”, but, fortunately, it is outside the group for the options of the line.

```
4632 \group_begin:
4633   \@@_open_shorten:
4634   \keys_set:nn { nicematrix / xdots } { #3 }
4635   \@@_color:o \l_@_xdots_color_tl
4636   \@@_actually_draw_Ddots:
4637   \group_end:
4638 }
4639 }
```

The command `\@@_actually_draw_Ddots:` has the following implicit arguments:

- `\l_@_initial_i_int`
- `\l_@_initial_j_int`
- `\l_@_initial_open_bool`
- `\l_@_final_i_int`
- `\l_@_final_j_int`
- `\l_@_final_open_bool.`

```
4640 \cs_new_protected:Npn \@@_actually_draw_Ddots:
4641 {
4642   \bool_if:NTF \l_@_initial_open_bool
4643   {
4644     \@@_open_y_initial_dim:
4645     \@@_open_x_initial_dim:
4646   }
4647   { \@@_set_initial_coords_from_anchor:n { south-east } }
4648   \bool_if:NTF \l_@_final_open_bool
4649   {
4650     \@@_open_x_final_dim:
4651     \dim_set_eq:NN \l_@_x_final_dim \pgf@x
4652   }
4653   { \@@_set_final_coords_from_anchor:n { north-west } }
```

We have retrieved the coordinates in the usual way (they are stored in `\l_@_x_initial_dim`, etc.). If the parallelization of the diagonals is set, we will have (maybe) to adjust the fourth coordinate.

```
4654 \bool_if:NT \l_@_parallelize_diags_bool
4655 {
4656   \int_gincr:N \g_@_ddots_int
```

We test if the diagonal line is the first one (the counter `\g_@_ddots_int` is created for this usage).

```
4657 \int_compare:nNnTF { \g_@_ddots_int } = { \c_one_int }
```

If the diagonal line is the first one, we have no adjustment of the line to do but we store the Δ_x and the Δ_y of the line because these values will be used to draw the others diagonal lines parallels to the first one.

```
4658 {
```

```

4659         \dim_gset:Nn \g_@@_delta_x_one_dim
4660             { \l_@@_x_final_dim - \l_@@_x_initial_dim }
4661         \dim_gset:Nn \g_@@_delta_y_one_dim
4662             { \l_@@_y_final_dim - \l_@@_y_initial_dim }
4663     }

```

If the diagonal line is not the first one, we have to adjust the second extremity of the line by modifying the coordinate `\l_@@_x_initial_dim`.

```

4664     {
4665         \dim_compare:nNnF { \g_@@_delta_x_one_dim } = { \c_zero_dim }
4666             {
4667                 \dim_set:Nn \l_@@_y_final_dim
4668                     {
4669                         \l_@@_y_initial_dim +
4670                         ( \l_@@_x_final_dim - \l_@@_x_initial_dim ) *
4671                         \dim_ratio:nn \g_@@_delta_y_one_dim \g_@@_delta_x_one_dim
4672                     }
4673             }
4674         }
4675     }
4676 \@@_draw_line:
4677 }

```

We draw the `\Iddots` diagonals in the same way.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

4678 \cs_new_protected:Npn \@@_draw_Iddots:nnn #1 #2 #3

4726     }
4727 }
4728 \@@_draw_line:
4729 }
```

17 The actual instructions for drawing the dotted lines with Tikz

The command `\@@_draw_line:` should be used in a `{pgfpicture}`. It has six implicit arguments:

- `\l_@@_x_initial_dim`
- `\l_@@_y_initial_dim`
- `\l_@@_x_final_dim`
- `\l_@@_y_final_dim`
- `\l_@@_initial_open_bool`
- `\l_@@_final_open_bool`

```

4730 \cs_new_protected:Npn \@@_draw_line:
4731 {
4732     \pgfrememberpicturepositiononpagetrue
4733     \pgf@relevantforpicturesizefalse
4734     \bool_lazy_or:nnTF
4735     { \tl_if_eq_p:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl }
4736     { \l_@@_dotted_bool }
4737     { \@@_draw_standard_dotted_line: }
4738     { \@@_draw_unstandard_dotted_line: }
4739 }
```

We have to do a special construction with `\exp_args:Npn` to be able to put in the list of options in the correct place in the Tikz instruction.

```

4740 \cs_new_protected:Npn \@@_draw_unstandard_dotted_line:
4741 {
4742     \begin { scope }
4743     \@@_draw_unstandard_dotted_line:o
4744         { \l_@@_xdots_line_style_tl , \l_@@_xdots_color_tl }
4745 }
```

We have used the fact that, in PGF, un color name can be put directly in a list of options (that's why we have put diretly `\l_@@_xdots_color_tl`).

The argument of `\@@_draw_unstandard_dotted_line:n` is, in fact, the list of options.

```

4746 \cs_new_protected:Npn \@@_draw_unstandard_dotted_line:n #1
4747 {
4748     \@@_draw_unstandard_dotted_line:nooo
4749         { #1 }
4750         \l_@@_xdots_up_tl
4751         \l_@@_xdots_down_tl
4752         \l_@@_xdots_middle_tl
4753 }
4754 \cs_generate_variant:Nn \@@_draw_unstandard_dotted_line:n { o }
```

The following Tikz styles are for the three labels (set by the symbols `_`, `^` and `=`) of a continuous line with a non-standard style.

```

4755 \hook_gput_code:nnn { begindocument } { . }
4756 {
4757     \IfPackageLoadedT { tikz }
4758     {
4759         \tikzset
4760         {
4761             @@_node_above / .style = { sloped , above } ,
4762             @@_node_below / .style = { sloped , below } ,
4763             @@_node_middle / .style =
4764             {
4765                 sloped ,
4766                 inner_sep = \c_@@_innersep_middle_dim
4767             }
4768         }
4769     }
4770 }
```

```

4771 \cs_new_protected:Npn \@@_draw_unstandard_dotted_line:nnnn #1 #2 #3 #4
4772 {
```

We take into account the parameters `xdots/shorten-start` and `xdots/shorten-end` “by hand” because, when we use the key `shorten >` and `shorten <` of TikZ in the command `\draw`, we don't have the expected output with `{decorate,decoration=brace}` is used.

The dimension `\l_@@_l_dim` is the length ℓ of the line to draw. We use the floating point reals of the L3 programming layer to compute this length.

```

4773 \dim_zero_new:N \l_@@_l_dim
4774 \dim_set:Nn \l_@@_l_dim
4775 {
4776     \fp_to_dim:n
4777     {
4778         sqrt
4779         (
4780             ( \l_@@_x_final_dim - \l_@@_x_initial_dim ) ^ 2
4781             +
4782             ( \l_@@_y_final_dim - \l_@@_y_initial_dim ) ^ 2
4783         )
4784     }
4785 }
```

It seems that, during the first compilations, the value of $\l_@@_l_dim$ may be erroneous (equal to zero or very large). We must detect these cases because they would cause errors during the drawing of the dotted line. Maybe we should also write something in the aux file to say that one more compilation should be done.

```

4786 \dim_compare:nNnT { \l_@@_l_dim } < { \c_@@_max_l_dim }
4787 {
4788     \dim_compare:nNnT { \l_@@_l_dim } > { 1 pt }
4789         \@@_draw_unstandard_dotted_line_i:
4790 }

```

If the key xdots/horizontal-labels has been used.

```

18 User commands available in the new environments

The commands `\@_Ldots:`, `\@_Cdots:`, `\@_Vdots:`, `\@_Ddots:` and `\@_Iddots:` will be linked to `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots` and `\Iddots` in the environments `{NiceArray}` (the other environments of `nicematrix` rely upon `{NiceArray}`).

The syntax of these commands uses the character `_` as embellishment and that's why we have to insert a character `_` in the *arg spec* of these commands. However, we don't know the future catcode of `_` in the main document (maybe the user will use `underscore`, and, in that case, the catcode is 13 because `underscore` activates `_`). That's why these commands will be defined in a `\hook_gput_code:nnn { begindocument } { . }` and the *arg spec* will be rescanned.

```
5002 \hook_gput_code:nnn { begindocument } { . }
5003 {
```

We rescan the *argspec* in order the correct catcode of `_` in the main document (and that's why we are in a `\AtBeginDocument`).

```

5107         { \phantom { \ensuremath { \old_iddots: } } } }
5108     \bool_gset_true:N \g_@@_empty_cell_bool
5109 }
5110 }
```

End of the `\AddToHook`.

Despite its name, the following set of keys will be used for `\Ddots` but also for `\Iddots`.

```

5111 \keys_define:nn { nicematrix / Ddots }
5112 {
5113     draw-first .bool_set:N = \l_@@_draw_first_bool ,
5114     draw-first .default:n = true ,
5115     draw-first .value_forbidden:n = true
5116 }
```

The command `\@@_Hspace:` will be linked to `\hspace` in `{NiceArray}`.

```

5117 \cs_new_protected:Npn \@@_Hspace:
5118 {
5119     \bool_gset_true:N \g_@@_empty_cell_bool
5120     \hspace
5121 }
```

In the environments of `nicematrix`, the command `\multicolumn` is redefined. We will patch the environment `{tabular}` to go back to the previous value of `\multicolumn`.

```
5122 \cs_set_eq:NN \@@_old_multicolumn: \multicolumn
```

The command `\@@_Hdotsfor` will be linked to `\Hdotsfor` in `{NiceArrayWithDelims}`. Tikz nodes are created also in the implicit cells of the `\Hdotsfor` (maybe we should modify that point).

This command must *not* be protected since it begins with `\multicolumn`.

```

5123 \cs_new:Npn \@@_Hdotsfor:
5124 {
5125     \bool_lazy_and:nnTF
5126         { \int_if_zero_p:n { \c@jCol } }
5127         { \int_if_zero_p:n { \l_@@_first_col_int } }
5128     {
5129         \bool_if:NTF \g_@@_after_col_zero_bool
5130             {
5131                 \multicolumn { 1 } { c } { }
5132                 \@@_Hdotsfor_i:
5133             }
5134             { \@@_fatal:n { Hdotsfor~in~col~0 } }
5135     }
5136     {
5137         \multicolumn { 1 } { c } { }
5138         \@@_Hdotsfor_i:
5139     }
5140 }
```

The command `\@@_Hdotsfor_i:` is defined with `\NewDocumentCommand` because it has an optional argument. Note that such a command defined by `\NewDocumentCommand` is protected and that's why we have put the `\multicolumn` before (in the definition of `\@@_Hdotsfor:`).

```

5141 \hook_gput_code:nnn { begindocument } { . }
5142 {
```

We don't put `!` before the last optional argument for homogeneity with `\Cdots`, etc. which have only one optional argument.

```

5143 \cs_new_protected:Npn \@@_Hdotsfor_i:
5144     { \@@_collect_options:n { \@@_Hdotsfor_ii } }
```

We rescan the *argspec* in order the correct catcode of `_` in the main document (and that's why we are in a `\AtBeginDocument`).

```

19 The command `\line` accessible in code-after

In the `\CodeAfter`, the command `\@@_line:nn` will be linked to `\line`. This command takes two arguments which are the specifications of two cells in the array (in the format $i-j$) and draws a dotted line between these cells. In fact, it also works with names of blocks.

First, we write a command with the following behaviour:

- If the argument is of the format $i-j$, our command applies the command `\int_eval:n` to i and j ;
- If not (that is to say, when it's a name of a `\Block`), the argument is left unchanged.

This must *not* be protected (and is, of course fully expandable).¹⁴

5374     \@@_draw_line:
5375 }

```

The commands `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, and `\Iddots` don’t use this command because they have to do other settings (for example, the diagonal lines must be parallelized).

20 The command `\RowStyle`

`\g_@@_row_style_tl` may contain several instructions of the form:

```

\@@_if_row_less_than:nn { number } { instructions }

```

Then, `\g_@@_row_style_tl` will be inserted in all the cells of the array (and also in both components of a `\diagbox` in a cell of in a mono-row block).

The test `\@@_if_row_less_then:nn` ensures that the instructions are inserted only if you are in a row which is (still) in the scope of that instructions (which depends on the value of the key `nb-rows` of `\RowStyle`).

That test will be active even in an expandable context because `\@@_if_row_less_then:nn` is *not* protected.

#1 is the first row *after* the scope of the instructions in #2

However, both arguments are implicit because they are taken by curryfication.

```
5376 \cs_new:Npn \@@_if_row_less_than:nn { \int_compare:nNnT { \c@iRow } < }
5377 \cs_new:Npn \@@_if_col_greater_than:nn { \int_compare:nNnF { \c@jCol } < }
```

`\@@_put_in_row_style` will be used several times in `\RowStyle`.

```

```

21 Colors of cells, rows and columns

We want to avoid the thin white lines that are shown in some PDF viewers (eg: with the engine MuPDF used by SumatraPDF). That's why we try to draw rectangles of the same color in the same instruction `\pgfusepath { fill }` (and they will be in the same instruction `fill`—coded `f`—in the resulting PDF).

The commands `\@@_rowcolor`, `\@@_columncolor`, `\@@_rectanglecolor` and `\@@_rowlistcolors` don't directly draw the corresponding rectangles. Instead, they store their instructions color by color:

- A sequence `\g_@@_colors_seq` will be built containing all the colors used by at least one of these instructions. Each *color* may be prefixed by its color model (eg: `[gray]{0.5}`).
- For the color whose index in `\g_@@_colors_seq` is equal to *i*, a list of instructions which use that color will be constructed in the token list `\g_@@_color_i_tl`. In that token list, the instructions will be written using `\@@_cartesian_color:nn` and `\@@_rectanglecolor:nn`.

`#1` is the color and `#2` is an instruction using that color. Despite its name, the command `\@@_add_to_colors_seq:nn` doesn't only add a color to `\g_@@_colors_seq`: it also updates the

corresponding token list `\g_@@_color_i_tl`. We add in a global way because the final user may use the instructions such as `\cellcolor` in a loop of `pgffor` in the `\CodeBefore` (and we recall that a loop of `pgffor` is encapsulated in a group).

```
5510 \cs_new_protected:Npn \@@_add_to_colors_seq:nn #1 #2
5511 {
```

First, we look for the number of the color and, if it's found, we store it in `\l_tmpa_int`. If the color is not present in `\l_@@_colors_seq`, `\l_tmpa_int` will remain equal to 0.

```
5512 \int_zero:N \l_tmpa_int
```

We don't take into account the colors like `myserie!!+` because those colors are special color from a `\definecolorseries` of `xcolor`. `\str_if_in:nnF` is mandatory: don't use `\tl_if_in:nnF`.

```
5513 \str_if_in:nnF { #1 } { !! }
5514 {
5515   \seq_map_indexed_inline:Nn \g_@@_colors_seq
```

We use `\str_if_eq:eeTF` which is slightly faster than `\tl_if_eq:nnTF`.

```
5516   { \str_if_eq:eeT { #1 } { ##2 } { \int_set:Nn \l_tmpa_int { ##1 } } }
5517   }
5518 \int_if_zero:nTF { \l_tmpa_int }
```

First, the case where the color is a *new* color (not in the sequence).

```
5519 {
5520   \seq_gput_right:Nn \g_@@_colors_seq { #1 }
5521   \tl_gset:ce { g_@@_color _ \seq_count:N \g_@@_colors_seq _ tl } { #2 }
5522 }
```

Now, the case where the color is *not* a new color (the color is in the sequence at the position `\l_tmpa_int`).

```
5523   { \tl_gput_right:ce { g_@@_color _ \int_use:N \l_tmpa_int _ tl } { #2 } }
5524 }
5525 \cs_generate_variant:Nn \@@_add_to_colors_seq:nn { e }
5526 \cs_generate_variant:Nn \@@_add_to_colors_seq:nn { e e }
```

The following command must be used within a `\pgfpicture`.

```
5527 \cs_new_protected:Npn \@@_clip_with_rounded_corners:
5528 {
5529   \dim_compare:nNnT { \l_@@_tab_rounded_corners_dim } > { \c_zero_dim }
5530 }
```

The TeX group is for `\pgfsetcornersarced` (whose scope is the TeX scope).

```
5531 \group_begin:
5532 \pgfsetcornersarced
5533 {
5534   \pgfpoint
5535     { \l_@@_tab_rounded_corners_dim }
5536     { \l_@@_tab_rounded_corners_dim }
5537 }
```

Because we want `nicematrix` compatible with arrays constructed by `array`, the nodes for the rows and columns (that is to say the nodes `row-i` and `col-j`) have not always the expected position, that is to say, there is sometimes a slight shifting of something such as `\arrayrulewidth`. Now, for the clipping, we have to change slightly the position of that clipping whether a rounded rectangle around the array is required. That's the point which is tested in the following line.

```
5538 \bool_if:NTF \l_@@_hvlines_bool
5539 {
5540   \pgfpathrectanglecorners
5541   {
5542     \pgfpointadd
5543       { \qpoint:n { row-1 } }
5544       { \pgfpoint { 0.5 \arrayrulewidth } { \c_zero_dim } }
5545   }
5546   {
5547     \pgfpointadd
5548       {
```

```

5549          \@@_qpoint:n
5550          { \int_eval:n { \int_max:nn { \c@iRow } { \c@jCol } + 1 } }
5551      }
5552      { \pgfpoint \c_zero_dim { 0.5 \arrayrulewidth } }
5553  }
5554  {
5555  \pgfpathrectanglecorners
5556  { \@@_qpoint:n { row-1 } }
5557  {
5558  \pgfpointadd
5559  {
5560  \@@_qpoint:n
5561  { \int_eval:n { \int_max:nn { \c@iRow } { \c@jCol } + 1 } }
5562  }
5563  { \pgfpoint \c_zero_dim \arrayrulewidth }
5564  }
5565  }
5566  }
5567  \pgfusepath { clip }
5568  \group_end:

```

The TeX group was for `\pgfsetcornersarced`.

```

5569  }
5570 }

```

The macro `\@@_actually_color:` will actually fill all the rectangles, color by color (using the sequence `\l_@@_colors_seq` and all the token lists of the form `\l_@@_color_i_tl`).

```

5571 \cs_new_protected:Npn \@@_actually_color:
5572  {
5573  \pgfpicture
5574  \pgf@relevantforpicturesizefalse

5609 }
```

The following set of keys is used by the command `\@@_color_opacity:wn`.

```

5610 \keys_define:nn { nicematrix / color-opacity }
5611 {
5612   opacity .tl_set:N      = \l_tmpa_tl ,
5613   opacity .value_required:n = true
5614 }
```

Here, we use `\def` instead of `\tl_set:Nn` for efficiency only.

```

5615 \cs_new_protected:Npn \@@_cartesian_color:nn #1 #2
5616 {
5617   \def \l_@@_rows_tl { #1 }
5618   \def \l_@@_cols_tl { #2 }
5619   \@@_cartesian_path:
5620 }
```

Here is an example : `\@@_rowcolor {red!15} {1,3,5-7,10-}`

```

5621 \NewDocumentCommand \@@_rowcolor { O { } m m }
5622 {
5623   \tl_if_blank:nF { #2 }
5624   {
5625     \@@_add_to_colors_seq:en
5626     { \tl_if_blank:nF { #1 } { [ #1 ] } { #2 } }
5627     { \@@_cartesian_color:nn { #3 } { - } }
5628   }
5629 }
```

Here an example: `\@@_columncolor:nn {red!15} {1,3,5-7,10-}`

```

5630 \NewDocumentCommand \@@_columncolor { O { } m m }
5631 {
5632   \tl_if_blank:nF { #2 }
5633   {
5634     \@@_add_to_colors_seq:en
5635     { \tl_if_blank:nF { #1 } { [ #1 ] } { #2 } }
5636     { \@@_cartesian_color:nn { - } { #3 } }
5637   }
5638 }
```

Here is an example: `\@@_rectanglecolor{red!15}{2-3}{5-6}`

```

5639 \NewDocumentCommand \@@_rectanglecolor { O { } m m m }
5640 {
5641   \tl_if_blank:nF { #2 }
5642   {
5643     \@@_add_to_colors_seq:en
5644     { \tl_if_blank:nF { #1 } { [ #1 ] } { #2 } }
5645     { \@@_rectanglecolor:nnn { #3 } { #4 } { \c_zero_dim } }
5646   }
5647 }
```

The last argument is the radius of the corners of the rectangle.

```

5648 \NewDocumentCommand \@@_roundedrectanglecolor { 0 { } m m m m }
5649 {
5650   \tl_if_blank:nF { #2 }
5651   {
5652     \@@_add_to_colors_seq:en
5653     { \tl_if_blank:nF { #1 } { [ #1 ] } { #2 } }
5654     { \@@_rectanglecolor:nnn { #3 } { #4 } { #5 } }
5655   }
5656 }
```

The last argument is the radius of the corners of the rectangle.

```

5657 \cs_new_protected:Npn \@@_rectanglecolor:nnn #1 #2 #3
5658 {
5659   \@@_cut_on_hyphen:w #1 \q_stop
5660   \tl_set_eq:NN \l_@@_tmpc_tl \l_tmpa_tl
5661   \tl_set_eq:NN \l_@@_tmpd_tl \l_tmpb_tl

5663   \tl_set:Ne \l_@@_rows_tl { \l_@@_tmpc_tl - \l_tmpa_tl }
5664   \tl_set:Ne \l_@@_cols_tl { \l_@@_tmpd_tl - \l_tmpb_tl }
```

The command `\@@_cartesian_path:n` takes in two implicit arguments: `\l_@@_cols_tl` and `\l_@@_rows_tl`.

```

5665   \@@_cartesian_path:n { #3 }
5666 }
```

Here is an example: `\@@_cellcolor[rgb]{0.5,0.5,0}{2-3,3-4,4-5,5-6}`

```

5667 \NewDocumentCommand \@@_cellcolor { 0 { } m m }
5668 {
5669   \clist_map_inline:nn { #3 }
5670   { \@@_rectanglecolor [ #1 ] { #2 } { ##1 } { ##1 } }
5671 }

5672 \NewDocumentCommand \@@_chessboardcolors { 0 { } m m }
5673 {
5674   \int_step_inline:nn { \c@iRow }
5675   {
5676     \int_step_inline:nn { \c@jCol }
5677     {
5678       \int_if_even:nTF { ####1 + ##1 }
5679       { \@@_cellcolor [ #1 ] { #2 } }
5680       { \@@_cellcolor [ #1 ] { #3 } }
5681       { ##1 - ####1 }
5682     }
5683   }
5684 }
```

The command `\@@_arraycolor` (linked to `\arraycolor` at the beginning of the `\CodeBefore`) will color the whole tabular (excepted the potential exterior rows and columns) and the cells in the “corners”.

```

5685 \NewDocumentCommand \@@_arraycolor { 0 { } m }
5686 {
5687   \@@_rectanglecolor [ #1 ] { #2 }
5688   { 1 - 1 }
5689   { \int_use:N \c@iRow - \int_use:N \c@jCol }
5690 }

5691 \keys_define:nn { nicematrix / rowcolors }
5692 {
5693   respect-blocks .bool_set:N = \l_@@_respect_blocks_bool ,
```

```

5694     respect-blocks .default:n = true ,
5695     cols .tl_set:N = \l_@@_cols_tl ,
5696     restart .bool_set:N = \l_@@_rowcolors_restart_bool ,
5697     restart .default:n = true ,
5698     unknown .code:n = \@@_error:n { Unknown~key~for~rowcolors }
5699 }

```

The command `\rowcolors` (accessible in the `\CodeBefore`) is inspired by the command `\rowcolors` of the package `xcolor` (with the option `table`). However, the command `\rowcolors` of `nicematrix` has *not* the optional argument of the command `\rowcolors` of `xcolor`.

Here is an example: `\rowcolors{1}{blue!10}{}[respect-blocks]`.

In `nicematrix`, the command `\@@_rowcolors` appears as a special case of `\@@_rowlistcolors`.

#1 (optional) is the color space; #2 is a list of intervals of rows; #3 is the list of colors; #4 is for the optional list of pairs `key=value`.

```

5700 \NewDocumentCommand \@@_rowlistcolors { 0 { } m m 0 { } }
5701 {

```

The group is for the options. `\l_@@_colors_seq` will be the list of colors.

```

5702 \group_begin:
5703 \seq_clear_new:N \l_@@_colors_seq
5704 \seq_set_split:Nnn \l_@@_colors_seq { , } { #3 }
5705 \tl_clear_new:N \l_@@_cols_tl
5706 \tl_set:Nn \l_@@_cols_tl { - }
5707 \keys_set:nn { nicematrix / rowcolors } { #4 }

```

The counter `\l_@@_color_int` will be the rank of the current color in the list of colors (modulo the length of the list).

```

5708 \int_zero_new:N \l_@@_color_int
5709 \int_set_eq:NN \l_@@_color_int \c_one_int
5710 \bool_if:NT \l_@@_respect_blocks_bool
5711 {

```

We don't want to take into account a block which is completely in the "first column" (number 0) or in the "last column" and that's why we filter the sequence of the blocks (in the sequence `\l_tmpa_seq`).

```

5712 \seq_set_eq:NN \l_tmpb_seq \g_@@_pos_of_blocks_seq
5713 \seq_set_filter:NNn \l_tmpa_seq \l_tmpb_seq
5714 { \@@_not_in_exterior_p:nnnn ##1 }
5715 }
5716 \pgfpicture
5717 \pgf@relevantforpicturesizefalse

```

#2 is the list of intervals of rows.

```

5718 \clist_map_inline:nn { #2 }
5719 {
5720     \tl_set:Nn \l_tmpa_tl { ##1 }
5721     \tl_if_in:NnTF \l_tmpa_tl { - }
5722     { \@@_cut_on_hyphen:w ##1 \q_stop }
5723     { \tl_set:Nn \l_tmpb_tl { \int_use:N \c@iRow } }

```

Now, `\l_tmpa_tl` and `\l_tmpb_tl` are the first row and the last row of the interval of rows that we have to treat. The counter `\l_tmpa_int` will be the index of the loop over the rows.

```

5724 \int_set:Nn \l_tmpa_int \l_tmpa_tl
5725 \int_set:Nn \l_@@_color_int
5726 { \bool_if:NTF \l_@@_rowcolors_restart_bool { 1 } { \l_tmpa_tl } }
5727 \int_set:Nn \l_@@_tmpc_int \l_tmpb_tl
5728 \int_do_until:nNn \l_tmpa_int > \l_@@_tmpc_int
5729 {

```

We will compute in `\l_tmpb_int` the last row of the "block".

```

5730 \int_set_eq:NN \l_tmpb_int \l_tmpa_int

```

If the key `respect-blocks` is in force, we have to adjust that value (of course).

```

5731 \bool_if:NT \l_@@_respect_blocks_bool
5732 {
5733     \seq_set_filter:Nnn \l_tmpb_seq \l_tmpa_seq
5734     { \@@_intersect_our_row_p:nnnnn #####1 }
5735     \seq_map_inline:Nn \l_tmpb_seq { \@@_rowcolors_i:nnnnn #####1 }

```

Now, the last row of the block is computed in `\l_tmpb_int`.

```

5736     }
5737     \tl_set:Ne \l_@@_rows_tl
5738     { \int_use:N \l_tmpa_int - \int_use:N \l_tmpb_int }

```

`\l_@@_tmpc_tl` will be the color that we will use.

```

5739     \tl_set:Ne \l_@@_color_tl
5740     {
5741         \@@_color_index:n
5742         {
5743             \int_mod:nn
5744             { \l_@@_color_int - 1 }
5745             { \seq_count:N \l_@@_colors_seq }
5746             + 1
5747         }
5748     }
5749     \tl_if_empty:NF \l_@@_color_tl
5750     {
5751         \@@_add_to_colors_seq:ee

5754     }
5755     \int_incr:N \l_@@_color_int
5756     \int_set:Nn \l_tmpa_int { \l_tmpb_int + 1 }
5757 }
5758 }
5759 \endpgfpicture
5760 \group_end:
5761 }

```

The command `\@@_color_index:n` peekes in `\l_@@_colors_seq` the color at the index #1. However, if that color is the symbol `=`, the previous one is poken. This macro is recursive.

```

5762 \cs_new:Npn \@@_color_index:n #1
5763 {

```

Be careful: this command `\@@_color_index:n` must be “*fully expandable*”.

```

5764 \str_if_eq:eeTF { \seq_item:Nn \l_@@_colors_seq { #1 } } { = }
5765 { \@@_color_index:n { #1 - 1 } }
5766 { \seq_item:Nn \l_@@_colors_seq { #1 } }
5767 }

```

The command `\rowcolors` (available in the `\CodeBefore`) is a specialisation of the more general command `\rowlistcolors`. The last argument, which is a optional argument between square brackets is provided by curryfication.

```

5768 \NewDocumentCommand \@@_rowcolors { O{ } m m m }
5769 { \@@_rowlistcolors [ #1 ] { #2 } { { #3 } , { #4 } } }

```

The braces around #3 and #4 are mandatory.

```

5770 \cs_new_protected:Npn \@@_rowcolors_i:nnnnn #1 #2 #3 #4 #5
5771 {
5772     \int_compare:nNnT { #3 } > { \l_tmpb_int }
5773     { \int_set:Nn \l_tmpb_int { #3 } }
5774 }

```

```

5775 \prg_new_conditional:Nnn \c@_not_in_exterior:nnnnn { p }
5776 {
5777     \int_if_zero:nTF { #4 }
5778     { \prg_return_false: }
5779     {
5780         \int_compare:nNnTF { #2 } > { \c@jCol }
5781         { \prg_return_false: }
5782         { \prg_return_true: }
5783     }
5784 }

```

The following command return `true` when the block intersects the row `\l_tmpa_int`.

```

5785 \prg_new_conditional:Nnn \c@_intersect_our_row:nnnnn { p }
5786 {
5787     \int_compare:nNnTF { #1 } > { \l_tmpa_int }
5788     { \prg_return_false: }
5789     {
5790         \int_compare:nNnTF { \l_tmpa_int } > { #3 }
5791         { \prg_return_false: }
5792         { \prg_return_true: }
5793     }
5794 }

```

The following command uses two implicit arguments: `\l_@@_rows_t1` and `\l_@@_cols_t1` which are specifications for a set of rows and a set of columns. It creates a path but does *not* fill it. It must be filled by another command after. The argument is the radius of the corners. We define below a command `\c@_cartesian_path:` which corresponds to a value 0 pt for the radius of the corners. This command is, in particular, used in `\c@_rectanglecolor:nnn` (used in `\c@_rectanglecolor`, itself used in `\c@_cellcolor`).

```

5795 \cs_new_protected:Npn \c@_cartesian_path_normal:n #1
5796 {
5797     \dim_compare:nNnTF { #1 } = { \c_zero_dim }
5798     {

5958       { \int_use:N \c@iRow - \exp_not:n { \int_use:N \c@jCol } }
5959   }
5960   \ignorespaces
5961 }

```

The following command will be linked to `\rowcolors` in the tabular. The last argument (an optional argument between square brackets is taken by curryfication).

```

5962 \NewDocumentCommand { \@@_rowcolors_tabular } { O { } m m }
5963   { \@@_rowlistcolors_tabular [ #1 ] { { #2 } , { #3 } } }

```

The braces around #2 and #3 are mandatory.

The following command will be linked to `\rowlistcolors` in the tabular.

```

5964 \NewDocumentCommand { \@@_rowlistcolors_tabular } { O { } m O { } }
5965   {

```

A use of `\rowlistcolors` in the tabular erases the instructions `\rowlistcolors` which are in force. However, it's possible to put *several* instructions `\rowlistcolors` in the same row of a tabular: it may be useful when those instructions `\rowlistcolors` concerns different columns of the tabular (thanks to the key `cols` of `\rowlistcolors`). That's why we store the different instructions `\rowlistcolors` which are in force in a sequence `\g_@@_rowlistcolors_seq`. Now, we will filter that sequence to keep only the elements which have been issued on the actual row. We will store the elements to keep in the `\g_tmpa_seq`.

```

5966   \seq_gclear:N \g_tmpa_seq
5967   \seq_map_inline:Nn \g_@@_rowlistcolors_seq
5968     { \@@_rowlistcolors_tabular:nnnn ##1 }
5969   \seq_gset_eq:NN \g_@@_rowlistcolors_seq \g_tmpa_seq

```

Now, we add to the sequence `\g_@@_rowlistcolors_seq` (which is the list of the commands `\rowlistcolors` which are in force) the current instruction `\rowlistcolors`.

```

5970   \seq_gput_right:Ne \g_@@_rowlistcolors_seq
5971   {
5972     { \int_use:N \c@iRow }
5973     { \exp_not:n { #1 } }
5974     { \exp_not:n { #2 } }
5975     { restart , cols = \int_use:N \c@jCol - , \exp_not:n { #3 } }
5976   }
5977   \ignorespaces
5978 }

```

The following command will be applied to each component of `\g_@@_rowlistcolors_seq`. Each component of that sequence is a kind of 4-uple of the form `{#1}{#2}{#3}{#4}`.

#1 is the number of the row where the command `\rowlistcolors` has been issued.

#2 is the colorimetric space (optional argument of the `\rowlistcolors`).

#3 is the list of colors (mandatory argument of `\rowlistcolors`).

#4 is the list of `key=value` pairs (last optional argument of `\rowlistcolors`).

```

5979 \cs_new_protected:Npn \@@_rowlistcolors_tabular:nnnn #1 #2 #3 #4
5980 {
5981   \int_compare:nNnTF { #1 } = { \c@iRow }

```

We (temporary) keep in memory in `\g_tmpa_seq` the instructions which will still be in force after the current instruction (because they have been issued in the same row of the tabular).

```

5982   { \seq_gput_right:Nn \g_tmpa_seq { { #1 } { #2 } { #3 } { #4 } } }
5983   {
5984     \tl_gput_right:Ne \g_@@_pre_code_before_tl
5985     {
5986       \@@_rowlistcolors
5987         [ \exp_not:n { #2 } ]
5988         { #1 - \int_eval:n { \c@iRow - 1 } }
5989         { \exp_not:n { #3 } }
5990         [ \exp_not:n { #4 } ]
5991     }
5992   }
5993 }

```

The following command will be used at the end of the tabular, just before the execution of the `\g_@@_pre_code_before_tl`. It clears the sequence `\g_@@_rowlistcolors_seq` of all the commands `\rowlistcolors` which are (still) in force.

```

5994 \cs_new_protected:Npn \@@_clear_rowlistcolors_seq:
5995 {
5996   \seq_map_inline:Nn \g_@@_rowlistcolors_seq
5997     { \@@_rowlistcolors_tabular_ii:nnnn ##1 }
5998   \seq_gclear:N \g_@@_rowlistcolors_seq
5999 }

```

```

6000 \cs_new_protected:Npn \@@_rowlistcolors_tabular_i:n#1 #2 #3 #4
6001 {

6003         { \@@_rowlistcolors [ #2 ] { #1 } { #3 } [ #4 ] }
6004 }

```

The first mandatory argument of the command `\@@_rowlistcolors` which is written in the pre-`\CodeBefore` is of the form `i:` it means that the command must be applied to all the rows from the row `i` until the end of the tabular.

```

6005 \NewDocumentCommand \@@_columncolor_preamble { O{ } m }
6006 {

```

With the following line, we test whether the cell is the first one we encounter in its column (don't forget that some rows may be incomplete).

```

6007 \int_compare:nNnT { \c@jCol } > { \g_@@_col_total_int }
6008 {

```

You use `gput_left` because we want the specification of colors for the columns drawn before the specifications of color for the rows (and the cells). Be careful: maybe this is not effective since we have an analyze of the instructions in the `\CodeBefore` in order to fill color by color (to avoid the thin white lines).

```

6032     }
6033 }

```

22 The vertical and horizontal rules

OnlyMainNiceMatrix

We give to the user the possibility to define new types of columns (with `\newcolumntype` of `array`) for special vertical rules (*e.g.* rules thicker than the standard ones) which will not extend in the potential exterior rows of the array.

We provide the command `\OnlyMainNiceMatrix` in that goal. However, that command must be no-op outside the environments of `nicematrix` (and so the user will be allowed to use the same new type of column in the environments of `nicematrix` and in the standard environments of `array`). That's why we provide first a global definition of `\OnlyMainNiceMatrix`.

```
6034 \cs_set_eq:NN \OnlyMainNiceMatrix \use:n
```

Another definition of `\OnlyMainNiceMatrix` will be linked to the command in the environments of `nicematrix`. Here is that definition, called `\@@_OnlyMainNiceMatrix:n`.

```
6035 \cs_new_protected:Npn \@@_OnlyMainNiceMatrix:n #1
6036 {
6037     \int_if_zero:nTF { \l_@@_first_col_int }
6038     { \@@_OnlyMainNiceMatrix_i:n { #1 } }
6039     {
6040         \int_if_zero:nTF { \c@jCol }
6041         {
6042             \int_compare:nNnF { \c@iRow } = { -1 }
6043             {
6044                 \int_compare:nNnF { \c@iRow } = { \l_@@_last_row_int - 1 }
6045                 { #1 }
6046             }
6047         }
6048         { \@@_OnlyMainNiceMatrix_i:n { #1 } }
6049     }
6050 }
```

This definition may seem complicated but we must remind that the number of row `\c@iRow` is incremented in the first cell of the row, *after* a potential vertical rule on the left side of the first cell. The command `\@@_OnlyMainNiceMatrix_i:n` is only a short-cut which is used twice in the above command. This command must *not* be protected.

```
6051 \cs_new_protected:Npn \@@_OnlyMainNiceMatrix_i:n #1
6052 {
6053     \int_if_zero:nF { \c@iRow }
6054     {
6055         \int_compare:nNnF { \c@iRow } = { \l_@@_last_row_int }
6056         {
6057             \int_compare:nNnT { \c@jCol } > { \c_zero_int }
6058             { \bool_if:NF \l_@@_in_last_col_bool { #1 } }
6059         }
6060     }
6061 }
```

Remember that `\c@iRow` is not always inferior to `\l_@@_last_row_int` because `\l_@@_last_row_int` may be equal to -2 or -1 (we can't write `\int_compare:nNnT \c@iRow < \l_@@_last_row_int`).

The following command will be used for `\Toprule`, `\BottomRule` and `\MidRule`.

```
6062 \cs_new:Npn \@@_tikz_booktabs_loaded:nn #1 #2

```

General system for drawing rules

When a command, environment or “subsystem” of nicematrix wants to draw a rule, it will write in the internal \CodeAfter a command \@@_vline:n or \@@_hline:n. Both commands take in as argument a list of key=value pairs. That list will first be analyzed with the following set of keys. However, unknown keys will be analyzed further with another set of keys.

```

6160 \keys_define:nn { nicematrix / Rules }
6161 {
6162   position .int_set:N = \l_@@_position_int ,
6163   position .value_required:n = true ,
6164   start .int_set:N = \l_@@_start_int ,
6165   end .code:n =
6166   \bool_lazy_or:nTF
6167   { \tl_if_empty_p:n { #1 } }
6168   { \str_if_eq_p:ee { #1 } { last } }
6169   { \int_set_eq:NN \l_@@_end_int \c@jCol }
6170   { \int_set:Nn \l_@@_end_int { #1 } }
6171 }
```

It's possible that the rule won't be drawn continuously from `start` to `end` because of the blocks (created with the command `\Block`), the virtual blocks (created by `\Cdots`, etc.), etc. That's why an analyse is done and the rule is cut in small rules which will actually be drawn. The small continuous rules will be drawn by `\@@_vline_ii:` and `\@@_hline_ii::`. Those commands use the following set of keys.

```

6172 \keys_define:nn { nicematrix / RulesBis }
6173 {
6174   multiplicity .int_set:N = \l_@@_multiplicity_int ,
6175   multiplicity .initial:n = 1 ,
6176   dotted .bool_set:N = \l_@@_dotted_bool ,
6177   dotted .initial:n = false ,
6178   dotted .default:n = true ,
```

We want that, even when the rule has been defined with TikZ by the key `tikz`, the user has still the possibility to change the color of the rule with the key `color` (in the command `\Hline`, not in the key `tikz` of the command `\Hline`). The main use is, when the user has defined its own command `\MyDashedLine` by `\newcommand{\MyDashedRule}{\Hline[tikz=dashed]}`, to give the ability to write `\MyDashedRule[color=red]`.

```

6179   color .code:n =
6180   \@@_set_CTarc:n { #1 }
```

```

6181   \tl_set:Nn \l_@@_rule_color_tl { #1 } ,
6182   color .value_required:n = true ,
6183   sep-color .code:n = \@@_set_CTDrsC:n { #1 } ,
6184   sep-color .value_required:n = true ,

```

If the user uses the key `tikz`, the rule (or more precisely: the different sub-rules since a rule may be broken by blocks or others) will be drawn with Tikz.

```

6506 }

```

The following code is for the case of a dotted rule (with our system of rounded dots). The aim is that, by standard the dotted line fits between square brackets (`\hline` doesn't).

```

\begin{bNiceMatrix}
1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}

```

$$\left[\begin{array}{cccc} 1 & 2 & 3 & 4 \\ 1 & 2 & 3 & 4 \\ \cdots & \cdots & \cdots & \cdots \\ 1 & 2 & 3 & 4 \end{array} \right]$$

But, if the user uses `margin`, the dotted line extends to have the same width as a `\hline`.

```

\begin{bNiceMatrix}[margin]
1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}

```

$$\left[\begin{array}{cccc} 1 & 2 & 3 & 4 \\ 1 & 2 & 3 & 4 \\ \cdots & \cdots & \cdots & \cdots \\ 1 & 2 & 3 & 4 \end{array} \right]$$

```

6602 }
```

Customized rules defined by the final user

The final user can define a customized rule by using the key `custom-line` in `\NiceMatrixOptions`. That key takes in as value a list of `key=value` pairs.

The following command will create the customized rule (it is executed when the final user uses the key `custom-line`, for example in `\NiceMatrixOptions`).

```

6603 \cs_new_protected:Npn @_custom_line:n #1
6604 {
6605     \str_clear_new:N \l_@_command_str
6606     \str_clear_new:N \l_@_ccommand_str
6607     \str_clear_new:N \l_@_letter_str
6608     \tl_clear_new:N \l_@_other_keys_tl
6609     \keys_set_known:nnN { nicematrix / custom-line } { #1 } \l_@_other_keys_tl
```

If the final user only wants to draw horizontal rules, he does not need to specify a letter (for the vertical rules in the preamble of the array). On the other hand, if he only wants to draw vertical rules, he does not need to define a command (which is the tool to draw horizontal rules in the array). Of course, a definition of custom lines with no letter and no command would be point-less.

```

```

23 The empty corners

When the key `corners` is raised, the rules are not drawn in the corners; they are not colored and `\TikzEveryCell` does not apply. Of course, we have to compute the corners before we begin to draw the rules.

```

6838 \cs_new_protected:Npn \@@_compute_corners:
6839 {
6840   \seq_map_inline:Nn \g_@@_pos_of_blocks_seq
6841   { \@@_mark_cells_of_block:nnnn ##1 }

```

The list `\l_@@_corners_cells_clist` will be the list of all the empty cells (and not in a block) considered in the corners of the array. We use a `cclist` instead of a `seq` because we will frequently search in that list (and searching in a `cclist` is faster than searching in a `seq`).

```

6842 \cclist_clear:N \l_@@_corners_cells_clist
6843 \cclist_map_inline:Nn \l_@@_corners_clist
6844 {
6845   \str_case:nnF { ##1 }
6846   {
6847     { NW }
6848     { \@@_compute_a_corner:nnnnnn 1 1 1 1 \c@iRow \c@jCol }
6849     { NE }
6850     { \@@_compute_a_corner:nnnnnn 1 \c@jCol 1 { -1 } \c@iRow 1 }
6851     { SW }
6852     { \@@_compute_a_corner:nnnnnn \c@iRow 1 { -1 } 1 1 \c@jCol }
6853     { SE }
6854     { \@@_compute_a_corner:nnnnnn \c@iRow \c@jCol { -1 } { -1 } 1 1 }
6855   }
6856   { \@@_error:nn { bad-corner } { ##1 } }
6857 }

```

Even if the user has used the key `corners` the list of cells in the corners may be empty.

```

6858 \cclist_if_empty:NF \l_@@_corners_cells_clist
6859 {

```

You write on the aux file the list of the cells which are in the (empty) corners because you need that information in the `\CodeBefore` since the commands which colors the `rows`, `columns` and `cells` must not color the cells in the corners.

```

6860 \tl_gput_right:Ne \g_@@_aux_tl
6861 {
6862   \cclist_set:Nn \exp_not:N \l_@@_corners_cells_clist
6863   { \l_@@_corners_cells_clist }
6864 }
6865 }
6866 }

```

```

6867 \cs_new_protected:Npn \@@_mark_cells_of_block:nnnnn #1 #2 #3 #4 #5
6868 {
6869   \int_step_inline:nnn { #1 } { #3 }
6870   {
6871     \int_step_inline:nnn { #2 } { #4 }
6872     { \cs_set_nopar:cpn { @@ _ block _ ##1 - #####1 } { } }
6873   }
6874 }

6875 \prg_new_conditional:Npnn \@@_if_in_block:nn #1 #2 { p }
6876 {
6877   \cs_if_exist:cTF
6878   { @@ _ block _ \int_eval:n { #1 } - \int_eval:n { #2 } }
6879   { \prg_return_true: }
6880   { \prg_return_false: }
6881 }

```

“Computing a corner” is determining all the empty cells (which are not in a block) that belong to that corner. These cells will be added to the sequence `\l_@@_corners_cells_clist`.

The six arguments of `\@@_compute_a_corner:nnnnnn` are as follow:

- #1 and #2 are the number of row and column of the cell which is actually in the corner;
- #3 and #4 are the steps in rows and the step in columns when moving from the corner;
- #5 is the number of the final row when scanning the rows from the corner;
- #6 is the number of the final column when scanning the columns from the corner.

```

6882 \cs_new_protected:Npn \@@_compute_a_corner:nnnnnn #1 #2 #3 #4 #5 #6
6883 {

```

For the explanations and the name of the variables, we consider that we are computing the left-upper corner.

First, we try to determine which is the last empty cell (and not in a block: we won’t add that precision any longer) in the column of number 1. The flag `\l_tmpa_bool` will be raised when a non-empty cell is found.

```

6884 \bool_set_false:N \l_tmpa_bool
6885 \int_zero_new:N \l_@@_last_empty_row_int
6886 \int_set:Nn \l_@@_last_empty_row_int { #1 }
6887 \int_step_inline:nnnn { #1 } { #3 } { #5 }
6888 {
6889   \bool_lazy_or:nnTF
6890   {
6891     \cs_if_exist_p:c
6892     { pgf @ sh @ ns @ \@@_env: - ##1 - \int_eval:n { #2 } }
6893   }
6894   { \@@_if_in_block_p:nn { ##1 } { #2 } }
6895   { \bool_set_true:N \l_tmpa_bool }
6896   {
6897     \bool_if:NF \l_tmpa_bool
6898     { \int_set:Nn \l_@@_last_empty_row_int { ##1 } }
6899   }
6900 }

```

Now, you determine the last empty cell in the row of number 1.

```

6901 \bool_set_false:N \l_tmpa_bool
6902 \int_zero_new:N \l_@@_last_empty_column_int
6903 \int_set:Nn \l_@@_last_empty_column_int { #2 }
6904 \int_step_inline:nnnn { #2 } { #4 } { #6 }
6905 {
6906   \bool_lazy_or:nnTF
6907   {

```

```

6908     \cs_if_exist_p:c
6909     { pgf @ sh @ ns @ \@@_env: - \int_eval:n { #1 } - ##1 }
6910   }
6911   { \@@_if_in_block_p:nn { #1 } { ##1 } }
6912   { \bool_set_true:N \l_tmpa_bool }
6913   {
6914     \bool_if:NF \l_tmpa_bool
6915     { \int_set:Nn \l_@@_last_empty_column_int { ##1 } }
6916   }
6917 }

```

Now, we loop over the rows.

```

6918 \int_step_inline:nnnn { #1 } { #3 } { \l_@@_last_empty_row_int }
6919 {

```

We treat the row number ##1 with another loop.

```

6920   \bool_set_false:N \l_tmpa_bool
6921   \int_step_inline:nnnn { #2 } { #4 } { \l_@@_last_empty_column_int }
6922   {
6923     \bool_lazy_or:nnTF
6924     { \cs_if_exist_p:c { pgf @ sh @ ns @ \@@_env: - ##1 - #####1 } }
6925     { \@@_if_in_block_p:nn { ##1 } { #####1 } }
6926     { \bool_set_true:N \l_tmpa_bool }
6927     {
6928       \bool_if:NF \l_tmpa_bool
6929       {
6930         \int_set:Nn \l_@@_last_empty_column_int { #####1 }
6931         \clist_put_right:Nn
6932           \l_@@_corners_cells_clist
6933           { ##1 - #####1 }
6934         \cs_set_nopar:cpn { @@ _ corner _ ##1 - #####1 } { }
6935       }
6936     }
6937   }
6938 }
6939 }

```

Of course, instead of the following lines, we could have use `\prg_new_conditional:Npnn`.

```

6940 \cs_new:Npn \@@_if_in_corner:nT #1 { \cs_if_exist:cT { @@ _ corner _ #1 } }
6941 \cs_new:Npn \@@_if_in_corner:nF #1 { \cs_if_exist:cF { @@ _ corner _ #1 } }

```

Instead of the previous lines, we could have used `\l_@@_corners_cells_clist` but it's less efficient:
`\clist_if_in:NeT \l_@@_corners_cells_clist { #1 } ...`

24 The environment {NiceMatrixBlock}

The following flag will be raised when all the columns of the environments of the block must have the same width in “auto” mode.

```

6942 \bool_new:N \l_@@_block_auto_columns_width_bool

```

Up to now, there is only one option available for the environment {NiceMatrixBlock}.

```

6943 \keys_define:nn { nicematrix / NiceMatrixBlock }
6944 {
6945   auto-columns-width .code:n =
6946   {
6947     \bool_set_true:N \l_@@_block_auto_columns_width_bool
6948     \dim_gzero_new:N \g_@@_max_cell_width_dim
6949     \bool_set_true:N \l_@@_auto_columns_width_bool
6950   }
6951 }

```

```

6952 \NewDocumentEnvironment { NiceMatrixBlock } { ! O { } }
6953 {
6954     \int_gincr:N \g_@@_NiceMatrixBlock_int
6955     \dim_zero:N \l_@@_columns_width_dim
6956     \keys_set:nn { nicematrix / NiceMatrixBlock } { #1 }
6957     \bool_if:NT \l_@@_block_auto_columns_width_bool
6958     {
6959         \cs_if_exist:cT
6960             { @@_max_cell_width_ \int_use:N \g_@@_NiceMatrixBlock_int }
6961         {
6962             \dim_set:Nn \l_@@_columns_width_dim
6963             {
6964                 \use:c
6965                     { @@_max_cell_width_ \int_use:N \g_@@_NiceMatrixBlock_int }
6966             }
6967         }
6968     }
6969 }

```

At the end of the environment {NiceMatrixBlock}, we write in the main aux file instructions for the column width of all the environments of the block (that's why we have stored the number of the first environment of the block in the counter \l_@@_first_env_block_int).

```

6970 {
6971     \legacy_if:nTF { measuring@ }

```

If {NiceMatrixBlock} is used in an environment of amsmath such as {align}: cf. question 694957 on TeX StackExchange. The most important line in that case is the following one.

```

6972 { \int_gdecr:N \g_@@_NiceMatrixBlock_int }
6973 {
6974     \bool_if:NT \l_@@_block_auto_columns_width_bool
6975     {
6976         \iow_shipout:Nn \Omainaux \ExplSyntaxOn
6977         \iow_shipout:Ne \Omainaux
6978         {
6979             \cs_gset:cpn
6980                 { @@_max_cell_width_ \int_use:N \g_@@_NiceMatrixBlock_int }

```

For technical reasons, we have to include the width of a potential rule on the right side of the cells.

```

6981 { \dim_eval:n { \g_@@_max_cell_width_dim + \arrayrulewidth } }
6982 }
6983 \iow_shipout:Nn \Omainaux \ExplSyntaxOff
6984 }
6985 }
6986 \ignorespacesafterend
6987 }

```

25 The extra nodes

The following command is called in \@@_use_arraybox_with_notes_c: just before the construction of the blocks (if the creation of medium nodes is required, medium nodes are also created for the blocks and that construction uses the standard medium nodes).

```

6988 \cs_new_protected:Npn \@@_create_extra_nodes:
6989 {
6990     \bool_if:nTF \l_@@_medium_nodes_bool
6991     {
6992         \bool_if:NTF \l_@@_no_cell_nodes_bool
6993             { \Oerror:n { extra-nodes-with-no-cell-nodes } }
6994             {
6995                 \bool_if:NTF \l_@@_large_nodes_bool

```

```

6996     \@@_create_medium_and_large_nodes:
6997         \@@_create_medium_nodes:
6998     }
6999 }
7000 {
7001     \bool_if:NT \l_@@_large_nodes_bool
7002     {
7003         \bool_if:NFT \l_@@_no_cell_nodes_bool
7004         { \@@_error:n { extra-nodes-with-no-cell-nodes } }
7005         \@@_create_large_nodes:
7006     }
7007 }
7008 }

```

We have three macros of creation of nodes: `\@@_create_medium_nodes:`, `\@@_create_large_nodes:` and `\@@_create_medium_and_large_nodes:`.

We have to compute the mathematical coordinates of the “medium nodes”. These mathematical coordinates are also used to compute the mathematical coordinates of the “large nodes”. That’s why we write a command `\@@_computations_for_medium_nodes:` to do these computations.

The command `\@@_computations_for_medium_nodes:` must be used in a `\{pgfpicture}`.

For each row i , we compute two dimensions `\l_@@_row_i_min_dim` and `\l_@@_row_i_max_dim`. The dimension `\l_@@_row_i_min_dim` is the minimal y -value of all the cells of the row i . The dimension `\l_@@_row_i_max_dim` is the maximal y -value of all the cells of the row i .

Similarly, for each column j , we compute two dimensions `\l_@@_column_j_min_dim` and `\l_@@_column_j_max_dim`. The dimension `\l_@@_column_j_min_dim` is the minimal x -value of all the cells of the column j . The dimension `\l_@@_column_j_max_dim` is the maximal x -value of all the cells of the column j .

Since these dimensions will be computed as maximum or minimum, we initialize them to `\c_max_dim` or `-\c_max_dim`.

```

7009 \cs_new_protected:Npn \@@_computations_for_medium_nodes:
7010 {
7011     \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
7012     {
7013         \dim_zero_new:c { \l_@@_row_ \@@_i: _min_dim }

7055       { \dim_use:c { l_@@_row_ \@@_i: _min_dim } } = \c_max_dim
7056     {
7057       \@@_qpoint:n { row - \@@_i: - base }
7058       \dim_set:cn { l_@@_row_ \@@_i: _max_dim } \pgf@y
7059       \dim_set:cn { l_@@_row_ \@@_i: _min_dim } \pgf@y
7060     }
7061   }
7062 \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
7063   {
7064     \dim_compare:nNnT
7065       { \dim_use:c { l_@@_column_ \@@_j: _min_dim } } = \c_max_dim
7066     {
7067       \@@_qpoint:n { col - \@@_j: }
7068       \dim_set:cn { l_@@_column_ \@@_j: _max_dim } \pgf@y
7069       \dim_set:cn { l_@@_column_ \@@_j: _min_dim } \pgf@y
7070     }
7071   }
7072 }

```

Here is the command `\@@_create_medium_nodes:`. When this command is used, the “medium nodes” are created.

```

7073 \cs_new_protected:Npn \@@_create_medium_nodes:
7074   {
7075     \pgfpicture
7076       \pgfrememberpicturepositiononpagetrue
7077       \pgfrelevantforpicturesizefalse
7078       \@@_computations_for_medium_nodes:

```

Now, we can create the “medium nodes”. We use a command `\@@_create_nodes:` because this command will also be used for the creation of the “large nodes”.

```

7079 \tl_set:Nn \l_@@_suffix_tl { -medium }
7080 \@@_create_nodes:

```

```

7081     \endpgfpicture
7082 }

```

The command `\@@_create_large_nodes:` must be used when we want to create only the “large nodes” and not the medium ones¹⁵. However, the computation of the mathematical coordinates of the “large nodes” needs the computation of the mathematical coordinates of the “medium nodes”. Hence, we use first `\@@_computations_for_medium_nodes:` and then the command `\@@_computations_for_large_nodes::`

```

7083 \cs_new_protected:Npn \@@_create_large_nodes:
7084 {
7085     \pgfpicture
7086         \pgfrememberpicturepositiononpagetrue
7087         \pgf@relevantforpicturesizefalse
7088         \@@_computations_for_medium_nodes:
7089         \@@_computations_for_large_nodes:
7090         \tl_set:Nn \l_@@_suffix_tl { - large }
7091         \@@_create_nodes:
7092     \endpgfpicture
7093 }

```

```

7094 \cs_new_protected:Npn \@@_create_medium_and_large_nodes:
7095 {
7096     \pgfpicture
7097         \pgfrememberpicturepositiononpagetrue
7098         \pgf@relevantforpicturesizefalse
7099         \@@_computations_for_medium_nodes:

```

Now, we can create the “medium nodes”. We use a command `\@@_create_nodes:` because this command will also be used for the creation of the “large nodes”.

```

7100     \tl_set:Nn \l_@@_suffix_tl { - medium }
7101     \@@_create_nodes:
7102     \@@_computations_for_large_nodes:
7103     \tl_set:Nn \l_@@_suffix_tl { - large }
7104     \@@_create_nodes:
7105 \endpgfpicture
7106 }

```

For “large nodes”, the exterior rows and columns don’t interfere. That’s why the loop over the columns will start at 1 and stop at `\c@jCol` (and not `\g_@@_col_total_int`). Idem for the rows.

```

7107 \cs_new_protected:Npn \@@_computations_for_large_nodes:
7108 {
7109     \int_set_eq:NN \l_@@_first_row_int \c_one_int
7110     \int_set_eq:NN \l_@@_first_col_int \c_one_int

```

We have to change the values of all the dimensions `l_@@_row_i_min_dim`, `l_@@_row_i_max_dim`, `l_@@_column_j_min_dim` and `l_@@_column_j_max_dim`.

```

7111     \int_step_variable:nNn { \c@iRow - 1 } \@@_i:
7112     {
7113         \dim_set:cn { l_@@_row_ \@@_i: _ min _ dim }
7114         {
7115             (
7116                 \dim_use:c { l_@@_row_ \@@_i: _ min _ dim } +
7117                 \dim_use:c { l_@@_row_ \int_eval:n { \@@_i: + 1 } _ max _ dim }
7118             )
7119             / 2
7120         }
7121         \dim_set_eq:cc { l_@@_row_ \int_eval:n { \@@_i: + 1 } _ max _ dim }
7122             { l_@@_row_ \@@_i: _ min_dim }
7123     }
7124     \int_step_variable:nNn { \c@jCol - 1 } \@@_j:

```

¹⁵If we want to create both, we have to use `\@@_create_medium_and_large_nodes:`

```

7125 {
7126   \dim_set:cn { l_@@_column _ \@@_j: _ max _ dim }
7127   {
7128     (
7129       \dim_use:c { l_@@_column _ \@@_j: _ max _ dim } +
7130       \dim_use:c
7131         { l_@@_column _ \int_eval:n { \@@_j: + 1 } _ min _ dim }
7132     )
7133     / 2
7134   }
7135   \dim_set_eq:cc { l_@@_column _ \int_eval:n { \@@_j: + 1 } _ min _ dim }
7136   { l_@@_column _ \@@_j: _ max _ dim }
7137 }

```

Here, we have to use `\dim_sub:cn` because of the number 1 in the name.

```

7138 \dim_sub:cn
7139   { l_@@_column _ 1 _ min _ dim }
7140   \l_@@_left_margin_dim
7141 \dim_add:cn
7142   { l_@@_column _ \int_use:N \c@jCol _ max _ dim }
7143   \l_@@_right_margin_dim
7144 }

```

The command `\@@_create_nodes:` is used twice: for the construction of the “medium nodes” and for the construction of the “large nodes”. The nodes are constructed with the value of all the dimensions `l_@@_row_i_min_dim`, `l_@@_row_i_max_dim`, `l_@@_column_j_min_dim` and `l_@@_column_j_max_dim`. Between the construction of the “medium nodes” and the “large nodes”, the values of these dimensions are changed.

The function also uses `\l_@@_suffix_tl` (-medium or -large).

```

7145 \cs_new_protected:Npn \@@_create_nodes:
7146 {
7147   \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
7148   {
7149     \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
7150   }

```

We draw the rectangular node for the cell (`\@@_i-\@@_j`).

```

7151 \@@_pgf_rect_node:nnnn
7152   { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl } }
7153   { \dim_use:c { l_@@_column_ \@@_j: _ min_dim } }
7154   { \dim_use:c { l_@@_row_ \@@_i: _ min_dim } }
7155   { \dim_use:c { l_@@_column_ \@@_j: _ max_dim } }
7156   { \dim_use:c { l_@@_row_ \@@_i: _ max_dim } }
7157 \str_if_empty:NF \l_@@_name_str
7158   {
7159     \pgfnodealias
7160       { \l_@@_name_str - \@@_i: - \@@_j: \l_@@_suffix_tl }
7161       { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
7162   }
7163 }
7164 }
7165 \int_step_inline:nn { \c@iRow }
7166 {
7167   \pgfnodealias
7168   { \@@_env: - ##1 - last \l_@@_suffix_tl }
7169   { \@@_env: - ##1 - \int_use:N \c@jCol \l_@@_suffix_tl }
7170 }
7171 \int_step_inline:nn { \c@jCol }
7172 {
7173   \pgfnodealias
7174   { \@@_env: - last - ##1 \l_@@_suffix_tl }
7175   { \@@_env: - \int_use:N \c@iRow - ##1 \l_@@_suffix_tl }
7176 }

```

```

7177   \pgfnodealias % added 2025-04-05
7178   { \g@@_env: - last - last \l_@@_suffix_tl }
7179   { \g@@_env: - \int_use:N \c@jRow - \int_use:N \c@jCol \l_@@_suffix_tl }

```

Now, we create the nodes for the cells of the `\multicolumn`. We recall that we have stored in `\g_@@_multicolumn_cells_seq` the list of the cells where a `\multicolumn{n}{...}{...}` with $n > 1$ was issued and in `\g_@@_multicolumn_sizes_seq` the correspondent values of n .

```

7180   \seq_map pairwise_function:NNN
7181   \g_@@_multicolumn_cells_seq
7182   \g_@@_multicolumn_sizes_seq
7183   \g@@_node_for_multicolumn:nn
7184 }

7185 \cs_new_protected:Npn \g@@_extract_coords_values: #1 - #2 \q_stop
7186 {
7187   \cs_set_nopar:Npn \g@@_i: { #1 }
7188   \cs_set_nopar:Npn \g@@_j: { #2 }
7189 }

```

The command `\g@@_node_for_multicolumn:nn` takes two arguments. The first is the position of the cell where the command `\multicolumn{n}{...}{...}` was issued in the format $i-j$ and the second is the value of n (the length of the “multi-cell”).

```

7190 \cs_new_protected:Npn \g@@_node_for_multicolumn:nn #1 #2
7191 {
7192   \g@@_extract_coords_values: #1 \q_stop
7193   \g@@_pgf_rect_node:nnnn
7194   { \g@@_env: - \g@@_i: - \g@@_j: \l_@@_suffix_tl }
7195   { \dim_use:c { l_@@_column _ \g@@_j: _ min _ dim } }
7196   { \dim_use:c { l_@@_row _ \g@@_i: _ min _ dim } }
7197   { \dim_use:c { l_@@_column _ \int_eval:n { \g@@_j: +#2-1 } _ max _ dim } }
7198   { \dim_use:c { l_@@_row _ \g@@_i: _ max _ dim } }
7199   \str_if_empty:NF \l_@@_name_str
7200   {
7201     \pgfnodealias
7202     { \l_@@_name_str - \g@@_i: - \g@@_j: \l_@@_suffix_tl }
7203     { \int_use:N \g_@@_env_int - \g@@_i: - \g@@_j: \l_@@_suffix_tl }
7204   }
7205 }

```

26 The blocks

The following code deals with the command `\Block`. This command has no direct link with the environment `{NiceMatrixBlock}`.

The options of the command `\Block` will be analyzed first in the cell of the array (and once again when the block will be put in the array). Here is the set of keys for the first pass (in the cell of the array).

```

7206 \keys_define:nn { nicematrix / Block / FirstPass }
7207 {
7208   j .code:n = \str_set:Nn \l_@@_hpos_block_str j
7209   \bool_set_true:N \l_@@_p_block_bool ,
7210   j .value_forbidden:n = true ,
7211   l .code:n = \str_set:Nn \l_@@_hpos_block_str l ,
7212   l .value_forbidden:n = true ,
7213   r .code:n = \str_set:Nn \l_@@_hpos_block_str r ,
7214   r .value_forbidden:n = true ,
7215   c .code:n = \str_set:Nn \l_@@_hpos_block_str c ,
7216   c .value_forbidden:n = true ,

```

```

7217 L .code:n = \str_set:Nn \l_@@_hpos_block_str l ,
7218 L .value_forbidden:n = true ,
7219 R .code:n = \str_set:Nn \l_@@_hpos_block_str r ,
7220 R .value_forbidden:n = true ,
7221 C .code:n = \str_set:Nn \l_@@_hpos_block_str c ,
7222 C .value_forbidden:n = true ,
7223 t .code:n = \str_set:Nn \l_@@_vpos_block_str t ,
7224 t .value_forbidden:n = true ,
7225 T .code:n = \str_set:Nn \l_@@_vpos_block_str T ,
7226 T .value_forbidden:n = true ,
7227 b .code:n = \str_set:Nn \l_@@_vpos_block_str b ,
7228 b .value_forbidden:n = true ,
7229 B .code:n = \str_set:Nn \l_@@_vpos_block_str B ,
7230 B .value_forbidden:n = true ,
7231 m .code:n = \str_set:Nn \l_@@_vpos_block_str c ,
7232 m .value_forbidden:n = true ,
7233 v-center .meta:n = m ,
7234 p .code:n = \bool_set_true:N \l_@@_p_block_bool ,
7235 p .value_forbidden:n = true ,
7236 color .code:n =
7237   \@@_color:n { #1 }
7238 \tl_set_rescan:Nnn
7239   \l_@@_draw_tl
7240   { \char_set_catcode_other:N ! }
7241   { #1 } ,
7242 color .value_required:n = true ,
7243 respect_arraystretch .code:n =
7244   \cs_set_eq:NN \@@_reset_arraystretch: \prg_do_nothing: ,
7245   respect_arraystretch .value_forbidden:n = true ,
7246 }

```

The following command `\@@_Block:` will be linked to `\Block` in the environments of `nicematrix`. We define it with `\NewExpandableDocumentCommand` because it has an optional argument between `<` and `>`. It's mandatory to use an expandable command.

```

7247 \cs_new_protected:Npn \@@_Block: { \@@_collect_options:n { \@@_Block_i: } }
7248 \NewExpandableDocumentCommand \@@_Block_i: { m m D < > { } +m }
7249 {

```

If the first mandatory argument of the command (which is the size of the block with the syntax $i-j$) has not been provided by the user, you use `1-1` (that is to say a block of only one cell).

```

7250 \tl_if_blank:nTF { #2 }
7251   { \@@_Block_ii:nnnn \c_one_int \c_one_int }
7252   {
7253     \int_compare:nNnTF { \char_value_catcode:n { 45 } } = { 13 }
7254     \@@_Block_i_czech:w \@@_Block_i:w
7255     #2 \q_stop
7256   }
7257   { #1 } { #3 } { #4 }
7258 \ignorespaces
7259 }

```

With the following construction, we extract the values of i and j in the first mandatory argument of the command.

```
7260 \cs_new:Npn \@@_Block_i:w #1-#2 \q_stop { \@@_Block_ii:nnnn { #1 } { #2 } }
```

With `babel` with the key `czech`, the character `-` (hyphen) is active. That's why we need a special version. Remark that we could not use a preprocessor in the command `\@@_Block:` to do the job because the command `\@@_Block:` is defined with the command `\NewExpandableDocumentCommand`.

```

7261 {
7262   \char_set_catcode_active:N -
7263   \cs_new:Npn \@@_Block_i_czech:w #1-#2 \q_stop { \@@_Block_ii:nnnn { #1 } { #2 } }
7264 }

```

Now, the arguments have been extracted: #1 is i (the number of rows of the block), #2 is j (the number of columns of the block), #3 is the list of key=values pairs, #4 are the tokens to put before the math mode and before the composition of the block and #5 is the label (=content) of the block.

```
7265 \cs_new_protected:Npn \@@_Block_ii:nnnnn #1 #2 #3 #4 #5
7266 {
```

We recall that #1 and #2 have been extracted from the first mandatory argument of \Block (which is of the syntax $i-j$). However, the user is allowed to omit i or j (or both). We detect that situation by replacing a missing value by 100 (it's a convention: when the block will actually be drawn these values will be detected and interpreted as *maximal possible value* according to the actual size of the array).

```
7267 \bool_lazy_or:nnTF
7268 { \tl_if_blank_p:n { #1 } }
7269 { \str_if_eq_p:ee { * } { #1 } }
7270 { \int_set:Nn \l_tmpa_int { 100 } }
7271 { \int_set:Nn \l_tmpa_int { #1 } }
7272 \bool_lazy_or:nnTF
7273 { \tl_if_blank_p:n { #2 } }
7274 { \str_if_eq_p:ee { * } { #2 } }
7275 { \int_set:Nn \l_tmpb_int { 100 } }
7276 { \int_set:Nn \l_tmpb_int { #2 } }
```

If the block is mono-column.

```
7277 \int_compare:nNnTF { \l_tmpb_int } = { \c_one_int }
7278 {
7279 \tl_if_empty:NTF \l_@@_hpos_cell_tl
7280 { \str_set_eq:NN \l_@@_hpos_block_str \c_@@_c_str }
7281 { \str_set:No \l_@@_hpos_block_str \l_@@_hpos_cell_tl }
7282 }
7283 { \str_set_eq:NN \l_@@_hpos_block_str \c_@@_c_str }
```

The value of \l_@@_hpos_block_str may be modified by the keys of the command \Block that we will analyze now.

```
7284 \keys_set_known:nn { nicematrix / Block / FirstPass } { #3 }
7285 \tl_set:Ne \l_tmpa_tl
7286 {
7287 { \int_use:N \c@iRow }
7288 { \int_use:N \c@jCol }
7289 { \int_eval:n { \c@iRow + \l_tmpa_int - 1 } }
7290 { \int_eval:n { \c@jCol + \l_tmpb_int - 1 } }
7291 }
```

Now, \l_tmpa_tl contains an “object” corresponding to the position of the block with four components, each of them surrounded by curly brackets:

{imin}{jmin}{imax}{jmax}.

We have different treatments when the key p is used and when the block is mono-column or mono-row, etc. That's why we have several macros: \@@_Block_iv:nnnnn, \@@_Block_v:nnnn, \@@_Block_vi:nnnn, etc. (the five arguments of those macros are provided by curryification).

```
7292 \bool_set_false:N \l_tmpa_bool
7293 \bool_if:NT \l_@@_amp_in_blocks_bool
```

\tl_if_in:nnT is slightly faster than \str_if_in:nnT.

```
7294 { \tl_if_in:nnT { #5 } { & } { \bool_set_true:N \l_tmpa_bool } }
7295 \bool_case:nF
7296 {
7297 { \l_tmpa_bool } { \@@_Block_vii:eennn }
7298 { \l_@@_p_block_bool } { \@@_Block_vi:eennn }
```

For the blocks mono-column, we will compose right now in a box in order to compute its width and take that width into account for the width of the column. However, if the column is a X column, we should not do that since the width is determined by another way. This should be the same for the p, m and b columns and we should modify that point. However, for the X column, it's imperative. Otherwise, the process for the determination of the widths of the columns will be wrong.

```

7299      \l_@@_X_bool                                { \@@_Block_v:eennn }
7300      { \tl_if_empty_p:n { #5 } }                 { \@@_Block_v:eennn }
7301      { \int_compare_p:nNn \l_tmpa_int = \c_one_int } { \@@_Block_iv:eennn }
7302      { \int_compare_p:nNn \l_tmpb_int = \c_one_int } { \@@_Block_iv:eennn }
7303    }
7304    { \@@_Block_v:eennn }
7305    { \l_tmpa_int } { \l_tmpb_int } { #3 } { #4 } { #5 }
7306  }

```

The following macro is for the case of a \Block which is mono-row or mono-column (or both) and don't use the key p. In that case, the content of the block is composed right now in a box (because we have to take into account the dimensions of that box for the width of the current column or the height and the depth of the current row). However, that box will be put in the array *after the construction of the array* (by using PGF) with \@@_draw_blocks: and above all \@@_Block_v:nnnnnn which will do the main job.

#1 is i (the number of rows of the block), #2 is j (the number of columns of the block), #3 is the list of key=values pairs, #4 are the tokens to put before the potential math mode and before the composition of the block and #5 is the label (=content) of the block.

```

7307 \cs_new_protected:Npn \@@_Block_iv:nnnnnn #1 #2 #3 #4 #5

7318       { \int_eval:n { \c@jCol + #2 - 1 } }
7319       { \g_@@_row_style_tl \exp_not:n { ##1 } }
7320       { \g_@@_row_style_tl \exp_not:n { ##2 } }
7321     }
7322   }
7323   \box_gclear_new:c
7324   { \g_@@_block_box _ \int_use:N \g_@@_block_box_int _ box }

```

Now, we will actually compose the content of the \Block in a TeX box. *Be careful:* if after the construction of the box, the boolean \g_@@_rotate_bool is raised (which means that the command \rotate was present in the content of the \Block) we will rotate the box but also, maybe, change the position of the baseline!

```

7325   \hbox_gset:cn
7326   { \g_@@_block_box _ \int_use:N \g_@@_block_box_int _ box }
7327   {

```

For a mono-column block, if the user has specified a color for the column in the preamble of the array, we want to fix that color in the box we construct. We do that with \set@color and not \color_ensure_current: (in order to use \color_ensure_current: safely, you should load l3backend before the \documentclass).

```

7328   \tl_if_empty:NTF \l_@@_color_tl
7329   { \int_compare:nNnT { #2 } = { \c_one_int } { \set@color } }
7330   { \@@_color:o \l_@@_color_tl }

```

If the block is mono-row, we use \g_@@_row_style_tl even if it has yet been used in the beginning of the cell where the command \Block has been issued because we want to be able to take into account a potential instruction of color of the font in \g_@@_row_style_tl.

```

7331   \int_compare:nNnT { #1 } = { \c_one_int }

```

```

7332     {
7333         \int_if_zero:nTF { \c@iRow }
7334     {

```

In the following code, the value of `code-for-first-row` contains a `\Block` (in order to have the “first row” centered). But, that block will be executed, since it is entirely contained in the first row, the value of `code-for-first-row` will be inserted once again... with the same command `\Block`. That’s why we have to nullify the command `\Block`.

```

$ \begin{bNiceMatrix}%
[ r,
  first-row,
  last-col,
  code-for-first-row = \Block{}{\scriptstyle\color{blue} \arabic{jCol}},
  code-for-last-col = \scriptstyle\color{blue} \arabic{iRow}
]
& & & & \\
-2 & 3 & -4 & 5 & \\
3 & -4 & 5 & -6 & \\
-4 & 5 & -6 & 7 & \\
5 & -6 & 7 & -8 & \\
\end{bNiceMatrix}%

7335         \cs_set_eq:NN \Block \@@_NullBlock:
7336         \l_@@_code_for_first_row_tl
7337     }
7338     {
7339         \int_compare:nNnT { \c@iRow } = { \l_@@_last_row_int }
7340         {
7341             \cs_set_eq:NN \Block \@@_NullBlock:
7342             \l_@@_code_for_last_row_tl
7343         }
7344     }
7345     \g_@@_row_style_tl
7346 }
```

The following command will be no-op when `respect-arraystretch` is in force.

```

7347     \@@_reset_arraystretch:
7348     \dim_zero:N \extrarowheight
```

`#4` is the optional argument of the command `\Block`, provided with the syntax `<...>`.

```
7349     #4
```

We adjust `\l_@@_hpos_block_str` when `\rotate` has been used (in the cell where the command `\Block` is used but maybe in `#4`, `\RowStyle`, `code-for-first-row`, etc.).

```
7350     \@@_adjust_hpos_rotate:
```

The boolean `\g_@@_rotate_bool` will be also considered *after the composition of the box* (in order to rotate the box).

Remind that we are in the command of composition of the box of the block. Previously, we have only done some tuning. Now, we will actually compose the content with a `{tabular}`, an `{array}` or a `{minipage}`.

```

7351     \bool_if:NTF \l_@@_tabular_bool
7352     {
7353         \bool_lazy_all:nTF
7354         {
7355             { \int_compare_p:nNn { #2 } = { \c_one_int } }
```

Remind that, when the column has not a fixed width, the dimension `\l_@@_col_width_dim` has the conventional value of `-1 cm`.

```

7356   {
7357     ! \dim_compare_p:nNn
7358       { \l_@@_col_width_dim } < { \c_zero_dim }
7359     }
7360   { ! \g_@@_rotate_bool }
7361 }
```

When the block is mono-column in a column with a fixed width (e.g. `p{3cm}`), we use a `{minipage}`.

```

7362   {
7363     \use:e
7364   }
```

The `\exp_not:N` is mandatory before `\begin`. It will be possible to delete the `\exp_not:N` in TeXLive 2025 because `\begin` is now protected by `\protected` (and not by `\protect`). There is several other occurrences in that document.

```

7365   \exp_not:N \begin { minipage }
7366     [ \str_lowercase:f \l_@@_vpos_block_str ]
7367     { \l_@@_col_width_dim }
7368     \str_case:on \l_@@_hpos_block_str
7369       { c \centering r \raggedleft l \raggedright }
7370     }
7371     #5
7372   \end { minipage }
7373 }
```

In the other cases, we use a `{tabular}`.

```

7374   {
7375     \bool_if:NT \c_@@_testphase_table_bool
7376       { \tagpdfsetup { table / tagging = presentation } }
7377     \use:e
7378     {
7379       \exp_not:N \begin { tabular }
7380         [ \str_lowercase:f \l_@@_vpos_block_str ]
7381         { @ { } \l_@@_hpos_block_str @ { } }
7382     }
7383     #5
7384   \end { tabular }
7385 }
7386 }
```

If we are in a mathematical array (`\l_@@_tabular_bool` is `false`). The composition is always done with an `{array}` (never with a `{minipage}`).

```

7387   {
7388     \c_math_toggle_token
7389     \use:e
7390     {
7391       \exp_not:N \begin { array }
7392         [ \str_lowercase:f \l_@@_vpos_block_str ]
7393         { @ { } \l_@@_hpos_block_str @ { } }
7394     }
7395     #5
7396   \end { array }
7397   \c_math_toggle_token
7398 }
7399 }
```

The box which will contain the content of the block has now been composed.

If there were `\rotate` (which raises `\g_@@_rotate_bool`) in the content of the `\Block`, we do a rotation of the box (and we also adjust the baseline of the rotated box).

```
7400 \bool_if:NT \g_@@_rotate_bool { \c_@@_rotate_box_of_block: }
```

If we are in a mono-column block, we take into account the width of that block for the width of the column.

```

7401 \int_compare:nNnT { #2 } = { \c_one_int }
7402 {
7403     \dim_gset:Nn \g_@@_blocks_wd_dim
7404     {
7405         \dim_max:nn
7406         { \g_@@_blocks_wd_dim }
7407         {
7408             \box_wd:c
7409             { g_@@_block _ box _ \int_use:N \g_@@_block_box_int _ box }
7410         }
7411     }
7412 }
```

If we are in a mono-row block we take into account the height and the depth of that block for the height and the depth of the row, excepted when the block uses explicitely an option of vertical position T or B. Remind that if the user has not used a key for the vertical position of the block, then `\l_@@_vpos_block_str` remains empty.

```

7413 \int_compare:nNnT { #1 } = { \c_one_int }
7414 {
7415     \bool_lazy_any:nT
7416     {
7417         { \str_if_empty_p:N \l_@@_vpos_block_str }
7418         { \str_if_eq_p:ee \l_@@_vpos_block_str { t } }
7419         { \str_if_eq_p:ee \l_@@_vpos_block_str { b } }
7420     }
7421     { \@@_adjust_blocks_ht_dp: }
7422 }
7423 \seq_gput_right:Ne \g_@@_blocks_seq
7424 {
7425     \l_tmpa_tl
```

In the list of options #3, maybe there is a key for the horizontal alignment (`l`, `r` or `c`). In that case, that key has been read and stored in `\l_@@_hpos_block_str`. However, maybe there were no key of the horizontal alignment and that's why we put a key corresponding to the value of `\l_@@_hpos_block_str`, which is fixed by the type of current column.

```

7426 {
7427     \exp_not:n { #3 } ,
7428     \l_@@_hpos_block_str ,
```

Now, we put a key for the vertical alignment.

```

7429     \bool_if:NT \g_@@_rotate_bool
7430     {
7431         \bool_if:NTF \g_@@_rotate_c_bool
7432         { m }

```

7669 \int_zero:N \l_@@_last_row_int
7670 \int_zero:N \l_@@_last_col_int

```

We remind that the first mandatory argument of the command `\Block` is the size of the block with the special format $i-j$. However, the user is allowed to omit i or j (or both). This will be interpreted as follows: the last row (resp. column) of the block will be the last row (resp. column) of the block (without the potential exterior row—resp. column—of the array). By convention, this is stored in `\g_@@_blocks_seq` as a number of rows (resp. columns) for the block equal to 100. That's what we detect now (we write 98 for the case the the command `\Block` has been issued in the “first row”).

```

Let's consider the following `\begin{NiceTabular}{cc!{\hspace{1cm}}c}`. Because of the instruction `!{\hspace{1cm}}` in the preamble which increases the space between the columns (by adding, in fact, that space to the previous column, that is to say the second column of the tabular), we will create *two* nodes relative to the block: the node `1-1-block` and the node `1-1-block-short`.

```

\begin{NiceTabular}{cc!{\hspace{1cm}}c}
\Block{2-2}{our block} & one & \\
& two & \\
three & four & five & \\
six & seven & eight &
\end{NiceTabular}

```

We highlight the node 1-1-block

our block	
three	four
six	seven

We highlight the node 1-1-block-short

our block	
one	
two	
five	
six	seven
eight	

The construction of the node corresponding to the merged cells.

```

7803  \pgfpicture
7804  \pgfrememberpicturepositiononpagetrue
7805  \pgf@relevantforpicturesizefalse
7806  \@@_qpoint:n { row - #1 }
7807  \dim_set_eq:NN \l_tmpa_dim \pgf@y
7808  \@@_qpoint:n { col - #2 }
7809  \dim_set_eq:NN \l_tmpb_dim \pgf@x
7810  \@@_qpoint:n { row - \int_eval:n { \l@@_last_row_int + 1 } }
7811  \dim_set_eq:NN \l@@_tmpc_dim \pgf@y
7812  \@@_qpoint:n { col - \int_eval:n { \l@@_last_col_int + 1 } }
7813  \dim_set_eq:NN \l@@_tmpd_dim \pgf@x

```

We construct the node for the block with the name (#1-#2-block).

The function `\@@_pgf_rect_node:nnnnn` takes in as arguments the name of the node and the four coordinates of two opposite corner points of the rectangle.

```

7814  \@@_pgf_rect_node:nnnnn
7815  { \@@_env: - #1 - #2 - block }
7816  \l_tmpb_dim \l_tmpa_dim \l@@_tmpd_dim \l@@_tmpc_dim
7817  \str_if_empty:NF \l@@_block_name_str
7818  {
7819    \pgfnodealias
7820    { \@@_env: - \l@@_block_name_str }
7821    { \@@_env: - #1 - #2 - block }
7822    \str_if_empty:NF \l@@_name_str
7823    {
7824      \pgfnodealias
7825      { \l@@_name_str - \l@@_block_name_str }
7826      { \@@_env: - #1 - #2 - block }
7827    }
7828  }

```

Now, we create the “short node” which, in general, will be used to put the label (that is to say the content of the node). However, if one the keys L, C or R is used (that information is provided by the boolean `\l@@_hpos_of_block_cap_bool`), we don’t need to create that node since the normal node is used to put the label.

```

7829  \bool_if:NF \l@@_hpos_of_block_cap_bool
7830  {
7831    \dim_set_eq:NN \l_tmpb_dim \c_max_dim

```

The short node is constructed by taking into account the *contents* of the columns involved in at least one cell of the block. That’s why we have to do a loop over the rows of the array.

```

7832  \int_step_inline:nnn { \l@@_first_row_int } { \g@@_row_total_int }
7833  {

```

We recall that, when a cell is empty, no (normal) node is created in that cell. That’s why we test the existence of the node before using it.

```

7834  \cs_if_exist:cT
7835  { pgf @ sh @ ns @ \@@_env: - ##1 - #2 }
7836  {
7837    \seq_if_in:NnF \g@@_multicolumn_cells_seq { ##1 - #2 }

8416     { \BNiceMatrix }
8417     { \endBNiceMatrix }
8418 }
```

28 Automatic arrays

We will extract some keys and pass the other keys to the environment `{NiceArrayWithDelims}`.

```
8419 \keys_define:nn { nicematrix / Auto }
8420   {
8421     columns-type .tl_set:N = \l_@@_columns_type_tl ,
8422     columns-type .value_required:n = true ,
8423     l .meta:n = { columns-type = l } ,
8424     r .meta:n = { columns-type = r } ,
8425     c .meta:n = { columns-type = c } ,
8426     delimiters / color .tl_set:N = \l_@@_delimiters_color_tl ,
8427     delimiters / color .value_required:n = true ,
8428     delimiters / max-width .bool_set:N = \l_@@_delimiters_max_width_bool ,
8429     delimiters / max-width .default:n = true ,
8430     delimiters .code:n = \keys_set:nn { nicematrix / delimiters } { #1 } ,
8431     delimiters .value_required:n = true ,
8432     rounded-corners .dim_set:N = \l_@@_tab_rounded_corners_dim ,
8433     rounded-corners .default:n = 4 pt
8434   }
8435 \NewDocumentCommand \AutoNiceMatrixWithDelims
8436   { m m O { } > { \SplitArgument { 1 } { - } } m O { } m ! O { } }
8437   { \@@_auto_nice_matrix:nnnnnn { #1 } { #2 } #4 { #6 } { #3 , #5 , #7 } }
8438 \cs_new_protected:Npn \@@_auto_nice_matrix:nnnnnn #1 #2 #3 #4 #5 #6
8439   { }
```

The group is for the protection of the keys.

```
8440   \group_begin:
8441     \keys_set_known:nnN { nicematrix / Auto } { #6 } \l_tmpa_tl
```

```

8442 \use:e
8443 {
8444   \exp_not:N \begin { NiceArrayWithDelims } { #1 } { #2 }
8445   { * { #4 } { \exp_not:o \l_@@_columns_type_tl } }
8446   [ \exp_not:o \l_tmpa_tl ]
8447 }
8448 \int_if_zero:nT { \l_@@_first_row_int }
8449 {
8450   \int_if_zero:nT { \l_@@_first_col_int } { & }
8451   \prg_replicate:nn { #4 - 1 } { & }
8452   \int_compare:nNnT { \l_@@_last_col_int } > { -1 } { & } \\
8453 }
8454 \prg_replicate:nn { #3 }
8455 {
8456   \int_if_zero:nT { \l_@@_first_col_int } { & }

```

We put { } before #6 to avoid a hasty expansion of a potential `\arabic{iRow}` at the beginning of the row which would result in an incorrect value of that `iRow` (since `iRow` is incremented in the first cell of the row of the `\halign`).

```

8457   \prg_replicate:nn { #4 - 1 } { { } #5 & } #5
8458   \int_compare:nNnT { \l_@@_last_col_int } > { -1 } { & } \\
8459 }
8460 \int_compare:nNnT { \l_@@_last_row_int } > { -2 }
8461 {
8462   \int_if_zero:nT { \l_@@_first_col_int } { & }
8463   \prg_replicate:nn { #4 - 1 } { & }
8464   \int_compare:nNnT { \l_@@_last_col_int } > { -1 } { & } \\
8465 }
8466 \end { NiceArrayWithDelims }
8467 \group_end:
8468 }

8469 \cs_set_protected:Npn \@@_define_com:NNN #1 #2 #3
8470 {
8471   \cs_set_protected:cpx { #1 AutoNiceMatrix }
8472   {
8473     \bool_gset_true:N \g_@@_delims_bool
8474     \str_gset:N \g_@@_name_env_str { #1 AutoNiceMatrix }
8475     \AutoNiceMatrixWithDelims { #2 } { #3 }
8476   }
8477 }

```

We define also a command `\AutoNiceMatrix` similar to the environment `{NiceMatrix}`.

```

8478 \NewDocumentCommand \AutoNiceMatrix { O{ } m O{ } m ! O{ } }
8479 {
8480   \group_begin:
8481   \bool_gset_false:N \g_@@_delims_bool
8482   \AutoNiceMatrixWithDelims . . { #2 } { #4 } [ #1 , #3 , #5 ]
8483   \group_end:
8484 }

```

29 The redefinition of the command `\dotfill`

```

8485 \cs_set_eq:NN \@@_old_dotfill: \dotfill
8486 \cs_new_protected:Npn \@@_dotfill:
8487 {

```

First, we insert `\@@_dotfill` (which is the saved version of `\dotfill`) in case of use of `\dotfill` “internally” in the cell (e.g. `\hbox to 1cm {\dotfill}`).

```

8488 \@@_old_dotfill:
```

```

8489      \tl_gput_right:Nn \g_@@_cell_after_hook_tl \@@_dotfill_i:
8490  }

```

Now, if the box is not empty (unfortunately, we can't actually test whether the box is empty and that's why we only consider its width), we insert `\@@_dotfill` (which is the saved version of `\dotfill`) in the cell of the array, and it will extend, since it is no longer in `\l_@@_cell_box`.

```

8491 \cs_new_protected:Npn \@@_dotfill_i:
8492 {
8493     \dim_compare:nNnT { \box_wd:N \l_@@_cell_box } = { \c_zero_dim }
8494     { \@@_old_dotfill: }
8495 }

```

30 The command `\diagbox`

The command `\diagbox` will be linked to `\diagbox:nn` in the environments of `nicematrix`. However, there are also redefinitions of `\diagbox` in other circumstances.

```

8496 \cs_new_protected:Npn \@@_diagbox:nn #1 #2
8497 {
8498     \tl_gput_right:Ne \g_@@_pre_code_after_tl
8499     {
8500         \@@_actually_diagbox:nnnnnn
8501         { \int_use:N \c@iRow }
8502         { \int_use:N \c@jCol }
8503         { \int_use:N \c@iRow }
8504         { \int_use:N \c@jCol }

```

`\g_@@_row_style_tl` contains several instructions of the form:

```
\@@_if_row_less_than:nn { number } { instructions }
```

The command `\@@_if_row_less:nn` is fully expandable and, thus, the instructions will be inserted in the `\g_@@_pre_code_after_tl` only if `\diagbox` is used in a row which is the scope of that chunk of instructions.

```

8505     { \g_@@_row_style_tl \exp_not:n { #1 } }
8506     { \g_@@_row_style_tl \exp_not:n { #2 } }
8507 }

```

We put the cell with `\diagbox` in the sequence `\g_@@_pos_of_blocks_seq` because a cell with `\diagbox` must be considered as non empty by the key `corners`.

```

8508 \seq_gput_right:Ne \g_@@_pos_of_blocks_seq
8509 {
8510     { \int_use:N \c@iRow }
8511     { \int_use:N \c@jCol }
8512     { \int_use:N \c@iRow }
8513     { \int_use:N \c@jCol }

```

The last argument is for the name of the block.

```

8514     { }
8515 }
8516 }

```

The command `\diagbox` is also redefined locally when we draw a block.

The first four arguments of `\@@_actually_diagbox:nnnnnn` correspond to the rectangle (=block) to slash (we recall that it's possible to use `\diagbox` in a `\Block`). The other two are the elements to draw below and above the diagonal line.

```

8517 \cs_new_protected:Npn \@@_actually_diagbox:nnnnnn #1 #2 #3 #4 #5 #6

8556 }
8557 {
8558 {
8559 \endpgfpicture
8560 }

```

31 The keyword `\CodeAfter`

In fact, in this subsection, we define the user command `\CodeAfter` for the case of the “normal syntax”. For the case of “light-syntax”, see the definition of the environment `{@@-light-syntax}` on p. 86.

In the environments of `nicematrix`, `\CodeAfter` will be linked to `\@@_CodeAfter::`. That macro must *not* be protected since it begins with `\omit`.

```
8561 \cs_new:Npn \@@_CodeAfter: { \omit \@@_CodeAfter_ii:n }
```

However, in each cell of the environment, the command `\CodeAfter` will be linked to the following command `\@@_CodeAfter_ii:n` which begins with `\\\`.

```
8562 \cs_new_protected:Npn \@@_CodeAfter_i: { \\ \omit \@@_CodeAfter_ii:n }
```

We have to catch everything until the end of the current environment (of `nicematrix`). First, we go until the next command `\end`.

```
8563 \cs_new_protected:Npn \@@_CodeAfter_ii:n #1 \end
8564 {
8565   \tl_gput_right:Nn \g_nicematrix_code_after_tl { #1 }
8566   \@@_CodeAfter_iv:n
8567 }
```

We catch the argument of the command `\end` (in #1).

```
8568 \cs_new_protected:Npn \@@_CodeAfter_iv:n #1
8569 {
```

If this is really the end of the current environment (of `nicematrix`), we put back the command `\end` and its argument in the TeX flow.

```
8570   \str_if_eq:eeTF \currenvir { #1 }
8571     { \end { #1 } }
```

If this is not the `\end` we are looking for, we put those tokens in `\g_nicematrix_code_after_tl` and we go on searching for the next command `\end` with a recursive call to the command `\@@_CodeAfter:n`.

```
8572   {
8573     \tl_gput_right:Nn \g_nicematrix_code_after_tl { \end { #1 } }
8574     \@@_CodeAfter_ii:n
8575   }
8576 }
```

32 The delimiters in the preamble

The command `\@@_delimiter:nnn` will be used to draw delimiters inside the matrix when delimiters are specified in the preamble of the array. It does *not* concern the exterior delimiters added by `{NiceArrayWithDelims}` (and `{pNiceArray}`, `{pNiceMatrix}`, etc.).

A delimiter in the preamble of the array will write an instruction `\@@_delimiter:nnn` in the `\g_@@_pre_code_after_tl` (and also potentially add instructions in the preamble provided to `\array` in order to add space between columns).

The first argument is the type of delimiter ((, [, \{,),] or \}). The second argument is the number of column. The third argument is a boolean equal to `\c_true_bool` (resp. `\c_false_true`) when the delimiter must be put on the left (resp. right) side.

```
8577 \cs_new_protected:Npn \@@_delimiter:nnn #1 #2 #3
8578 {
8579   \pgfpicture
8580   \pgfrememberpicturepositiononpagetrue
8581   \pgf@relevantforpicturesizefalse
```

`\l_@@_y_initial_dim` and `\l_@@_y_final_dim` will be the *y*-values of the extremities of the delimiter we will have to construct.

```
8582   \@@_qpoint:n { row - 1 }
8583   \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
8584   \@@_qpoint:n { row - \int_eval:n { \c@iRow + 1 } }
8585   \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
```

We will compute in `\l_tmpa_dim` the *x*-value where we will have to put our delimiter (on the left side or on the right side).

```
8586   \bool_if_ntF { #3 }
8587     { \dim_set_eq:NN \l_tmpa_dim \c_max_dim }
8588     { \dim_set:Nn \l_tmpa_dim { - \c_max_dim } }
8589   \int_step_inline:nnn { \l_@@_first_row_int } { \g_@@_row_total_int }
8590   {
8591     \cs_if_exist:cT
8592       { \pgf @ sh @ ns @ \@@_env: - ##1 - #2 }
```

```

8593   {
8594     \pgfpointanchor
8595       { \@@_env: - ##1 - #2 }
8596       { \bool_if:nTF { #3 } { west } { east } }
8597     \dim_set:Nn \l_tmpa_dim
8598     {
8599       \bool_if:nTF { #3 }
8600         { \dim_min:nn }
8601         { \dim_max:nn }
8602       \l_tmpa_dim
8603         { \pgf@x }
8604     }
8605   }
8606 }
```

Now we can put the delimiter with a node of PGF.

```

8607 \pgfset { inner_sep = \c_zero_dim }
8608 \dim_zero:N \nulldelimiterspace
8609 \pgftransformshift
8610 {
8611   \pgfpoint
8612     { \l_tmpa_dim }
8613     { ( \l_@@_y_initial_dim + \l_@@_y_final_dim + \arrayrulewidth ) / 2 }
8614   }
8615 \pgfnode
8616   { rectangle }
8617   { \bool_if:nTF { #3 } { east } { west } }
8618 }
```

Here is the content of the PGF node, that is to say the delimiter, constructed with its right size.

```

8619 \nullfont
8620 \c_math_toggle_token
8621 \color{o} \l_@@_delimiters_color_tl
8622 \bool_if:nTF { #3 } { \left #1 } { \left . }
8623 \vcenter
8624 {
8625   \nullfont
8626   \hrule \height
8627     \dim_eval:n { \l_@@_y_initial_dim - \l_@@_y_final_dim }
8628     \depth \c_zero_dim
8629     \width \c_zero_dim
8630   }
8631 \bool_if:nTF { #3 } { \right . } { \right #1 }
8632 \c_math_toggle_token
8633 }
8634 { }
8635 { }
8636 \endpgfpicture
8637 }
```

33 The command \SubMatrix

```

8638 \keys_define:nn { nicematrix / sub-matrix }
8639 {
8640   extra-height .dim_set:N = \l_@@_submatrix_extra_height_dim ,

```

In the pre-code-after and in the `\CodeAfter` the following command `\@@_SubMatrix` will be linked to `\SubMatrix`.

- #1 is the left delimiter;
- #2 is the upper-left cell of the matrix with the format $i-j$;
- #3 is the lower-right cell of the matrix with the format $i-j$;
- #4 is the right delimiter;
- #5 is the list of options of the command;
- #6 is the potential subscript;

- #7 is the potential superscript.

For explanations about the construction with rescanning of the preamble, see the documentation for the user command \Cdots.

8915          \l_@@_x_final_dim \l_@@_y_final_dim
8916      }
8917  \group_end:

```

The group was for `\CT@arc@` (the color of the rules).

Now, we deal with the left delimiter. Of course, the environment `{pgfscope}` is for the `\pgftransformshift`.

```

8918  \begin{ { pgfscope }
8919  \pgftransformshift
8920  {
8921      \pgfpoint
8922          { \l_@@_x_initial_dim - \l_@@_submatrix_left_xshift_dim }
8923          { ( \l_@@_y_initial_dim + \l_@@_y_final_dim ) / 2 }
8924      }
8925  \str_if_empty:NTF \l_@@_submatrix_name_str
8926      { \@@_node_left:nn #1 { } }
8927      { \@@_node_left:nn #1 { \@@_env: - \l_@@_submatrix_name_str - left } }
8928  \end { pgfscope }

```

Now, we deal with the right delimiter.

```

8929  \pgftransformshift
8930  {
8931      \pgfpoint
8932          { \l_@@_x_final_dim + \l_@@_submatrix_right_xshift_dim }
8933          { ( \l_@@_y_initial_dim + \l_@@_y_final_dim ) / 2 }
8934      }
8935  \str_if_empty:NTF \l_@@_submatrix_name_str
8936      { \@@_node_right:nnnn #2 { } { #3 } { #4 } }
8937      {
8938          \@@_node_right:nnnn #2
8939          { \@@_env: - \l_@@_submatrix_name_str - right } { #3 } { #4 }
8940      }

```

Now, we deal with the key `code` of `\SubMatrix`. That key should contain a TikZ instruction and the nodes in that instruction will be relative to the current `\SubMatrix`. That's why we need a redefinition of `\pgfpointanchor`.

```

8941  \cs_set_eq:NN \pgfpointanchor \@@_pgfpointanchor:n
8942  \flag_clear_new:N \l_@@_code_flag
8943  \l_@@_code_tl
8944  }

```

In the key `code` of the command `\SubMatrix` there may be TikZ instructions. We want that, in these instructions, the i and j in specifications of nodes of the forms $i-j$, `row-i`, `col-j` and $i-|j$ refer to the number of row and column *relative* of the current `\SubMatrix`. That's why we will patch (locally in the `\SubMatrix`) the command `\pgfpointanchor`.

```
8945  \cs_set_eq:NN \@@_old_pgfpointanchor: \pgfpointanchor
```

The following command will be linked to `\pgfpointanchor` just before the execution of the option `code` of the command `\SubMatrix`. In this command, we catch the argument `#1` of `\pgfpointanchor` and we apply to it the command `\@@_pgfpointanchor_i:nn` before passing it to the original `\pgfpointanchor`. We have to act in an expandable way because the command `\pgfpointanchor` is used in names of Tikz nodes which are computed in an expandable way.

The original command `\pgfpointanchor` takes in two arguments: the name of the node and the name of the anchor. However, you don't have to modify the anchor, and that's why we do a redefinition of `\pgfpointanchor` by curryfication.

```
8946 \cs_new:Npn \@@_pgfpointanchor:n #1
8947   { \exp_args:Ne \@@_old_pgfpoinctanchor: { \@@_pgfpointanchor_i:n { #1 } } }
```

First, we must detect whether the argument is of the form `\tikz@pp@name{...}` (the command `\tikz@pp@name` is a command of TikZ that adds the prefix and the suffix of the name. If the name refers to a TikZ node which does not exist, there isn't the wrapper `\tikz@pp@name`.

```
8948 \cs_new:Npn \@@_pgfpointanchor_i:n #1
8949   { \@@_pgfpointanchor_ii:w #1 \tikz@pp@name \q_stop }
8950 \cs_new:Npn \@@_pgfpointanchor_ii:w #1 \tikz@pp@name #2 \q_stop
8951   {
```

The command `\str_if_empty:nTF` is “fully expandable”.

```
8952 \str_if_empty:nTF { #1 }
```

First, when the name of the name begins with `\tikz@pp@name`.

```
8953   { \@@_pgfpointanchor_iv:w #2 }
```

And now, when there is no `\tikz@pp@name`.

```
8954   { \@@_pgfpointanchor_ii:n { #1 } }
8955 }
```

In the case where the name begins with `\tikz@pp@name`, we must retrieve the second `\tikz@pp@name`, that is to say to marker that we have added at the end (cf. `\@@_pgfpointanchor_i:n`).

```
8956 \cs_new:Npn \@@_pgfpointanchor_iv:w #1 \tikz@pp@name
8957   { \@@_pgfpointanchor_ii:n { #1 } }
```

With the command `\@@_pgfpointanchor_ii:n`, we deal with the actual name of the node (without the `\tikz@pp@name`). First, we have to detect whether it is of the form `i` or `i-j` (with an hyphen).

Remark: It would be possible to test the presence of the hyphen in an expandable way to using `\etl_if_in:nnTF` of the package `etl` but, as of now, we do not load `etl`.

```
8958 \cs_new:Npn \@@_pgfpointanchor_ii:n #1 { \@@_pgfpointanchor_i:w #1- \q_stop }
```

```
8959 \cs_new:Npn \@@_pgfpointanchor_i:w #1-#2 \q_stop
8960   {
```

The command `\str_if_empty:nTF` is “fully expandable”.

```
8961 \str_if_empty:nTF { #2 }
```

First the case where the argument does *not* contain an hyphen.

```
8962   { \@@_pgfpointanchor_iii:n { #1 } }
```

And now the case the argument contains a hyphen. In that case, we have a weird construction because we must retrieve the extra hyphen we have added as marker (cf. `\@@_pgfpointanchor_ii:n`).

```
8963   { \@@_pgfpointanchor_iii:w { #1 } #2 }
8964 }
```

The following function is for the case when the name contains an hyphen.

```
8965 \cs_new:Npn \@@_pgfpointanchor_iii:w #1 #2 -
8966   {
```

We have to add the prefix `\@@_env:` “by hand” since we have retrieved the potential `\tikz@pp@name`.

```
8967   \@@_env:
8968   - \int_eval:n { #1 + \l_@@_first_i_tl - 1 }
8969   - \int_eval:n { #2 + \l_@@_first_j_tl - 1 }
8970 }
```

Since `\seq_if_in:NnTF` and `\clist_if_in:NnTF` are not expandable, we will use the following token list and `\str_case:nVTF` to test whether we have an integer or not.

```

8971 \tl_const:Nn \c_@@_integers alist tl
8972 {
8973 { 1 } { } { 2 } { } { 3 } { } { 4 } { } { 5 } { }
8974 { 6 } { } { 7 } { } { 8 } { } { 9 } { } { 10 } { }
8975 { 11 } { } { 12 } { } { 13 } { } { 14 } { } { 15 } { }
8976 { 16 } { } { 17 } { } { 18 } { } { 19 } { } { 20 } { }
8977 }

8978 \cs_new:Npn \@@_pgfpointanchor_iii:n #1
8979 {

```

If there is no hyphen, that means that the node is of the form of a single number (ex.: 5 or 11). In that case, we are in an analysis which result from a specification of node of the form $i-j$. That special form is the reason of the special form of the argument of `\pgfpointanchor` which arises with its command `\name_of_command` (see above).

In that case, the i of the number of row arrives first (and alone) in a `\pgfpointanchor` and, the, the j arrives (alone) in the following `\pgfpointanchor`. In order to know whether we have a number of row or a number of column, we keep track of the number of such treatments by the expandable flag called `nicematrix`.

```

8980 \str_case:nVTF { #1 } \c_@@_integers alist tl
8981 {
8982     \flag_raise:N \l_@@_code_flag

```

We have to add the prefix `\@@_env`: “by hand” since we have retrieved the potential `\tikz@pp@name`.

```

8983 \@@_env: -

38 We process the options at package loading

We process the options when the package is loaded (with `\usepackage`) but we recommend to use `\NiceMatrixOptions` instead.

We must process these options after the definition of the environment `{NiceMatrix}` because the option `renew-matrix` executes the code `\cs_set_eq:NN \env@matrix \NiceMatrix`.

Of course, the command `\NiceMatrix` must be defined before such an instruction is executed.

The boolean `\g_@@_footnotehyper_bool` will indicate if the option `footnotehyper` is used.

```
9559 \bool_new:N \g_@@_footnotehyper_bool
```

The boolean `\g_@@_footnote_bool` will indicate if the option `footnote` is used, but quickly, it will also be set to `true` if the option `footnotehyper` is used.

```

```

If the user uses too much columns, the command `\@@_error_too_much_cols:` is triggered. This command raises an error but also tries to give the best information to the user in the error message. The command `\seq_if_in:NoF` is not expandable and that's why we can't put it in the error message itself. We have to do the test before the `\@@_fatal:n`.

```
